GLAST

DoE Review June 7 2006

A Glimpse of the Future

APOD 5/31/06

Organizing Science in the Collaboration

GLAST Reconstruction Anatomy of a "Typical" Event

Pair production is the dominant photon interaction in our energy range

- Reconstruction Goals:
 - Incident Gamma Direction and Energy
 - Reject Backgrounds
- Incident Gamma converts in the tracker
 - In particular, conversion occurs in one of the converter foils – ie at a well defined location
- Resulting electron-positron pair range out of tracker (TKR)...
 - No magnetic field, tracks are "straight lines"
 - Resulting two tracks "point" back to incident Gamma
- And into the Csl Calorimeter (CAL)
 - Measures total energy of electronpositron pair
 - = Gamma energy
- Surrounding Anti-Coincidence Detector (ACD) vetoes any wayward charged particles

GLAST Reconstruction

What makes it challenging...

1 GeV Gamma Track Opening Angle ~0 Conversion – Resolve in foil ~ 2 * 228 um / 30 mm = ~15 mr First Strip ~ Tray Measurement Pitch Spacing Point (in Y-Z Projection) < ~50 MeV photons to resolve ~30 mm tracks without "help" e+___ Looking for "v"s may not be the correct strategy for gamma direction Second Measurement reconstruction Point Well... see next slides... (in Y-Z Projection) Single Cluster - Can't **T.Usher** quite resolve two tracks 33.333336 mm

GLAST Reconstruction

What makes it challenging...

- Tracker has a lot of material
 - Actual tracker is ~ .3 rl
 - Could live with this...
 - Converter foils are ~ 1.1 rl
 - Love them: convert gamma
 - Hate them: tracking electrons
 - Total ~ 1.4 rl
 - For particles traversing active area of tracker
 - Does not include walls between towers, etc.
- Issues to deal with
 - Gammas can (and do) convert outside the foils
 - e⁺e⁻ pair interact with tracker
 - Multiple scatter
 - Primary e⁺ or e⁻ can stop in the tracker
 - e⁺ and e⁻ radiate energy
 - etc.
- T.Usher

GLAST Reconstruction

What makes it challenging...

- Calorimeter Issues
 - Measure Event Energy Not Track Energy(ies)
 - Don't have resolution to separate
 - Large fraction of measured energy from Brems
 - Implications for determining gamma direction when you do have two track events...
 - Measure Fraction of Event Energy
 - Energy "loss"
 - in tracker
 - Leaking out of Calorimeter
 - Significant contribution at
 - lower energies (e.g. < 1 GeV)</p>
 - for conversions starting higher in the tracker
 - Must augment total energy determination with contribution from tracker

T.Usher

GLAST

R.Dubois

Background Rejection

Example: Charged Particles in Tracker

T.Usher

- Project Track to plane of struck tile
- •Calculate distance to nearest edge
- •Sign

Positive if track projection inside the tile Negative if track projection outside the tile

•Reject if inside the tile

CAL Detail

- The 'Science Tools' are the high-level analysis tools for astronomy
- The core analysis tools have been defined and developed jointly with the GLAST Science Support Center (NASA/GSFC)
 - NASA staffed the GSSC early with this intent
 - These tools all adhere to the HEASARC FTOOL standards
- To the extent possible we have reused code from existing tools
 - Most notably for pulsar timing, e.g., barycenter arrival time corrections
- For source detection and characterization, the science tools use Instrument Response Functions (PSF, effective area, and energy dispersion as functions of relevant parameters), effectively abstracting the reconstruction and classification process
 - The greatest differences from the formalism for EGRET analysis is that the LAT will almost always be slewing, so that the response functions that apply to any given source also change continuously

Science Tools (2)

- After a period of definition and review, the tools have been developed incrementally, with the milestones for evaluation
 - Data Challenges (see later) as major milestones and 'Science Tools Checkouts' (3 so far) as intermediate ones
- The core Science Tools are
 - gtlikelihood, gtexpmap, and numerous associated utilities for defining a model of a region of the sky and fitting it via maximizing the likelihood function
 - gtrspgen, gtbin for generating response matrices and counts spectra for analysis of GRBs in XSPEC, including jointly with GBM data
 - gtbary, gtpphase, gtpsearch and associated utilitites for pulsar timing, periodicity tests
 - gtobssim, gtorbsim fast and flexible observation simulator using the IRFs, and an orbit/attitude simulator.

- What is the pipeline?
 - Envisaged as tool to provide a tree of processing on a given input dataset
 - Handle multiple "tasks" concurrently, eg LAT commissioning, DC2 Monte Carlo runs
 - Full bookkeeping to track what happened
 - Archive all files touched
- Used by whom?
 - Online
 - for sweeping integration data out of the clean room and to tape
 - populate eLogbook
 - SVAC (Science Verification and Calibrations)
 - for doing digi, recon
 - creating reports
 - Preparing for calibrations
 - Generic MC
 - DC2, background runs etc etc
 - ISOC (Instrument Science Operations Center)
 - Flight operations: Level 1 and 2
 - environmental testing, at Spectrum Astro, KSC
 - Data reprocessing

Pipeline 2

on experience from #1

- now robust, but lacking in areas of flexibility
- Revisited e len nts:

GLAST

- Task some fing would be more flexible that current linear chain
 - Shound su p parallel execution of tasks
 - Should allow the indency chain to be more general than the input file requirements •
 - Should suppor bara sub-tasks, with number of sub-tasks defined at runtime
 - Perhaps support co. At a p based on external dependencies
- Should allow for remote subless a **c** lobs
 - Perhaps using GRID batch is on component, or Glast specific batch submission system
 - Will need to generalize current syste () net rid of absolute paths) Support reprocessing of data without receipting as
- - Need way to mark Done task as "ReRunnable N
 - Need to support multiple versions of output files.
- Ability to Prioritize tasks
- Ability to work with "disk space allocator"
- Would be nice to set parameters (env vars) in task description
- Would be nice to be able to pass in parameters in "createJob"
- Ability to suspend tasks _
- Ability to kill tasks _
- Ability to throttle job submission (ie max number of jobs in queue)
- Ability to map absolute path names to FTP path names (site specific)
- Would be nice to remove need for "wrapper scripts"
- Ability to specify batch options (but portability problems)
- Redesigning database schema now ٠
- Targeting beamtest for production use

Instrument Data Access

- Ground software is amalgam of HEP instrument software and Astro FTOOLS
- Adopt HEP's "Data Challenges" to create a series of end-to-end studies: create a progression of ever more demanding studies
- Originated by the Mark2 experiment at SLAC while waiting for the SLC accelerator to deliver data
 - Test and oil the data analysis system from simulating the physics through full blown analyses
 - Details of physics and detector performance not revealed to the collaboration until closeout
 - Engage the collaboration and get it thinking science
- ISOC is an integral part of the collaboration
 - Exercise its part and interactions with the rest of the collaboration

- DC1. Modest goals. Contains most essential features of a data challenge.
 - 1 simulated day all-sky survey simulation
 - find GRBs
 - recognize simple hardware problem(s)
 - a few physics surprises
 - Exercise all the components
- DC2, kickoff Mar 1. More ambitious goals. Encourage further development, based on lessons from DC1. Two simulated months.
 - DC1 +
 - Much more data
 - Backgrounds included
 - More realistic GRBs
 - Pulsars, variable AGNs
 - More and more elaborate surprises
- DC3, in CY07. Support for flight science production.

DC Components

- Focal point for many threads "end to end system test"
 - Orbit, rocking, celestial coordinates, pointing history
 - Plausible model of the sky
 - Background rejection and event selection
 - Instrument Response Functions
 - Data formats for input to high level tools
 - Use of Science Tools
 - Generation of datasets
 - Populate and exercise data servers at SSC & LAT
 - Code distribution on windows and linux
- Involve new users from across the collaboration
- Teamwork!

Preparations for DC2

- Full background analysis this time!
 - Tremendous collaboration effort to reduce the backgrounds to Science Requirements levels
 - Revision of background model x4 higher than DC1 estimate
 - Detailed skymodel
 - Flaring objects; pulsars; joint GBM data(!); etc etc
 - Mechanically a huge change from DC1
 - Have to simulate backgrounds 10³ x signal
 - 100,000 CPU-hrs to simulate 1 day of background: 5 billion events
 - Machinery to randomly interleave that day 55 times, while simulating full rate deadtime effects
 - High-stress test of processing pipeline
 - ~400 CPUs running simultaneously for a week for the backgrounds runs
 - ~200,000 batch jobs total for DC2
 - Many scaling problems fixed

Monitoring Pipeline Throughput

Monitoring Disk Farm via SCS Tools

Documentation: User Workbook

Welcome to Data Challenge II !

Second in a sequence of 3 data challenges, DC2 will include extensive analysis of 55 days worth of realistic simulated data. Relative to DC1, many aspects of the simulated data have been improved

DC2's "Simulated Gamma-ray Sky" featured as APOD's picture of the day: May 31, 2006.

Closeout Agenda

- Full and realistic detector simulation, i.e., realistic in that simulations are imperfect, including things like dead strips, deadtime, etc.
- Full reconstruction chain from low level electronics quantities, to high level event information.
- Updated and detailed background model, including all the things that are not gamma-rays from celestial sources; also includes orbit variations.
- Rich description of the gamma-ray sky, including variable sources, pulsing sources and Gamma-Ray Bursts (GRBs).
- Revamped event classification and background rejection analysis, i.e., updated instrument performance plots.

Follow on lead from SLD, BABAR, but ...

work with Tech Writer •

> skilled at extracting information from us wackos

- worries about layout, organization
- can write good
- we're struggling with apparent conflict of web navigation vs "printed book". Pursuing the former.

GLAST

DoE Review June 7 2006

Code Distribution

Data Challenge II

http://www-glast.slac.stanford.edu/software/DataChallenges/DC2/JuneCloseout/

Closeout Meeting: 31 May – 2 June DC2 Coordinated by Julie McEnery, GSFC (I'm liberally swiping slides from her closeout talk!) 28/42

DC2 Goals, requirements and purpose

- 55 days of LAT data provide a deeper view of the high energy gamma-ray sky than has previously been achieved.
 - Results from previous gamma-ray missions provide, at best, an incomplete guide to the DC2 sky.
 - Part of the challenge of DC2 will be to figure out what was included in the sky model.
 - DC2 data has a fairly realistic level of detail which will support a wide variety of both science and instrument performance studies.
 - Exercise the science tools but don't feel restricted to them
 - Improve the documentation and analysis software from user feedback.

Gamma-ray sources in the DC2 Milky Way

- With the exception of Pulsars, which were based on a population model and a lot of research and fiddling, we included only likely examples each source class
 - Typically associated with an already-known source (sorry Olaf & Patrizia) without attempting a pop. synthesis
- 'Other 3EG' means that we included all non-spurious sources from the 3rd EGRET catalog (Hartman et al. 1999) even if we did not have a specific counterpart in mind

γ-rays (A+B)*

Milky Way itself (1)	1,704,807
Pulsars (414)	140,596
Plerions (7)	9780
SNR (11)	22,592
XRB (5)	1491
OB associations (4)	295
Small molecular clouds (40)	1741
Dark matter (~2)	5158
'Other 3EG' (120)	112,386
Sun (1 flare)	4669
Moon (1)	10,523

Produce LAT point source catalog

- Requirement: Spectral index and flux (with associated uncertainties), location with 68% and 95% confidence ranges, flux in discrete energy bands.
- Goal: Variability index, flux history, peak flux, measure of whether a source is extended.

The catalog analysis and results proved to be an extremely important part of DC2. It provided a starting point for a large fraction of the more detailed source analysis and was a reference for people doing population/source detection type studies.

There was a somewhat higher rate of false detections than would have been expected (~10%), this needs to be understood.

GLAST

LS 5039, LS I +615 & Friends Micro-quasar candidates in DC2

Toby's HEALPIX map + Saclay sources

Develop and test source detection algorithms

- **Requirement: That these** algorithms are tested and compared with one another in a systematic way using the DC2 data.
 - Many source detection methods developed -Stephens, Tosti, Burnett, Casandjian, Ballet, **Romeo/Cillis**
 - Compared with one another by Seth Digel

- Goal: blind periodicity searches on candidate DC2 pulsars
 - Use time differences to measure power
 - Look for frequency at peak power

Marcus Ziegler – lightcurves of pulsars without radio data.

Phased light curves for radio quiet pulsars

R.Dubois

35/42

Extended sources

- Hiro studying how to improve images by deconvoluting with the PSF
 - Can we use event by event measured errors?

Variable sources

- Requirement: Produce lightcurves for at least 20 bright sources (from the data release plan, these are the sources we will release high level data from in year 1)
- Goal: look at lightcurves for many more sources

Spectral Studies

 Riccardo Rando found a source that appeared to consist of two components, a pulsed hard component and a soft, steady component.

Gamma-ray bursts

132 generated in 4π 64 bursts seen in GBM 25 in LAT; 16 with > 4 γ This was one of the "rejected" fits due to the strange spectrum. The cause is likely to be because this GRB was simulated with an additional "hard" extended component lasting for 400s. GRB08015885 – Nukri Komin

Blind GRB Search

• spikes in LAT trigger rate $R = 10/\Delta t$ (rate for 10 events)

Other sources

- Requirement: Identify at least one source that is not a pulsar, AGN or GRB (there are some that can be identified from the gamma-ray data)
- Moon (Tosti, Rando)
- Sun (Tosti, Chiang)

Diffuse sources

- Goal: Study flux, spectra and spatial distribution of the galactic diffuse and compare with the diffuse model provided for source analysis.
- Studied by Jean Marc Casanjian, Andy Strong and Larry Wai

DC2 and Beyond

- The DC2 sky is probably the best rendition to date of the gamma ray sky
 - LATers took up the challenge and didn't just look for the obvious
- And... we now have a great dataset for future development!
 - 55 days of simulated downlink to practise with
 - Simulate downlink frequency
 - Test Data Monitoring
 - Develop Quicklook
- And then "DC3"
