OUTLINE

I

FUNDAMENTALS

Why XD?

Hiding & Seeking XD

XD interactions & UV breakdown

Unification of spins

→ Hierarchy Problem.

II

AERIAL RECONNAISSANCE

III

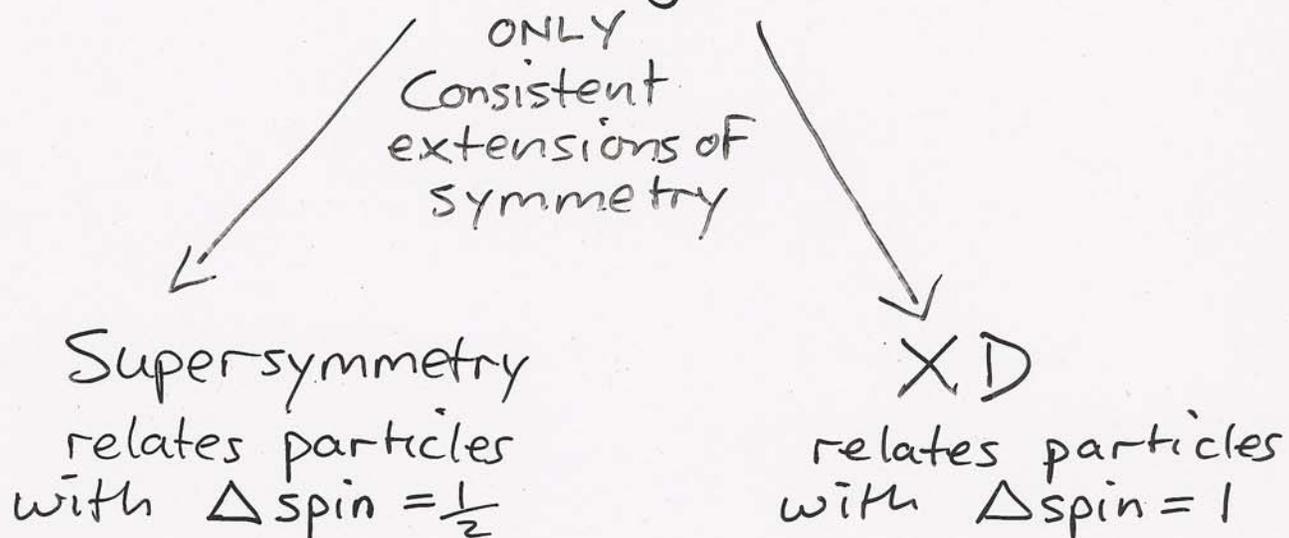

FROM THE TRENCHES

WHY XD?

1) Spacetime Symmetry

Poincare Group \ni Translations, Rotations, Boosts

+ new degrees of Freedom

($\&$ extended symmetry)
New degrees of Freedom must be hidden
at present energies but revealed in UV.

Transition scale unknown.

- 2) These extensions naturally \Rightarrow
interesting new mechanisms,
perhaps essential to our understanding
of the World.

3) String Theory (only well-developed framework reconciling gravity, relativity, QM) requires these extensions at highest energies.

4) Weakly-coupled phenomena in XD sometimes resemble strong-coupling phenomena (eg. QCD) without XD!

Sometimes,

Weakly-coupled XD theory
 \cong Strong-coupled theory without XD!

XD scalar field theory

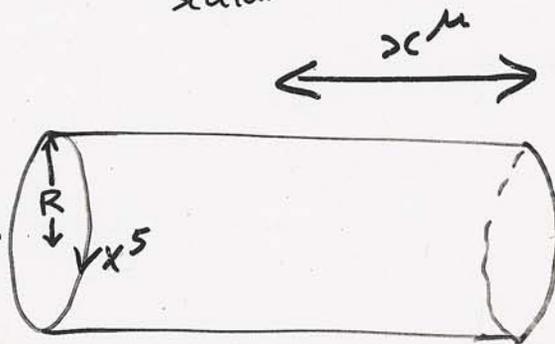

$$x^M = x^{\mu=0,1,2,3}, x^5, \text{ metric } \eta_{MN} = \begin{pmatrix} 1 & & & & \\ & -1 & & & \\ & & -1 & & \\ & & & \ddots & \\ & & & & -1 \end{pmatrix}$$

$$\mathcal{L}_{5D} = \frac{1}{2} \partial_M \phi \partial^M \phi - \frac{m_5^2}{2} \phi^2 - \lambda_5 \phi^4$$

real scalar

riding

"compact"
D circle,

breaks 5D

Lorentz invariance "softly"

For distances $> R$

$$x^5 \equiv R\theta, \quad -\pi \leq \theta \leq \pi$$

$$\phi(x^\mu, \theta) = \frac{1}{\sqrt{2\pi R}} \left\{ \underbrace{\phi_0(x)}_{\text{real}} + \sum_{n=1}^{\infty} \left(\underbrace{\phi_n(x)}_{\text{complex}} e^{in\theta} + \text{c.c.} \right) \right\}$$

$$S = \int d^4x \int_{-\pi}^{\pi} d\theta R \left\{ \frac{1}{2} \partial_\mu \phi \partial^\mu \phi - \frac{1}{2R^2} (\partial_\theta \phi)^2 - \frac{m_5^2}{2} \phi^2 - \lambda_5 \phi^4 \right\}$$

$$\begin{aligned}
&= \int d^4x \left[\frac{1}{2} (\partial_\mu \phi_0)^2 - \frac{m_5^2}{2} \phi_0^2 \right. \\
&\quad \left. + \sum_{n=1}^{\infty} \left[|\partial_\mu \phi_n|^2 - \left(\frac{n^2}{R^2} + m_5^2 \right) |\phi_n|^2 \right] \right. \\
&\quad \left. - \frac{\lambda_5}{2\pi R} \sum_{n_1=-\infty}^{\infty} \sum_{n_2=-\infty}^{\infty} \sum_{n_3=-\infty}^{\infty} \sum_{n_4=-\infty}^{\infty} \delta_{n_1+n_2+n_3+n_4, 0} \phi_{n_1} \phi_{n_2} \phi_{n_3} \phi_{n_4} \right]
\end{aligned}$$

conservation
of XD angular momentum

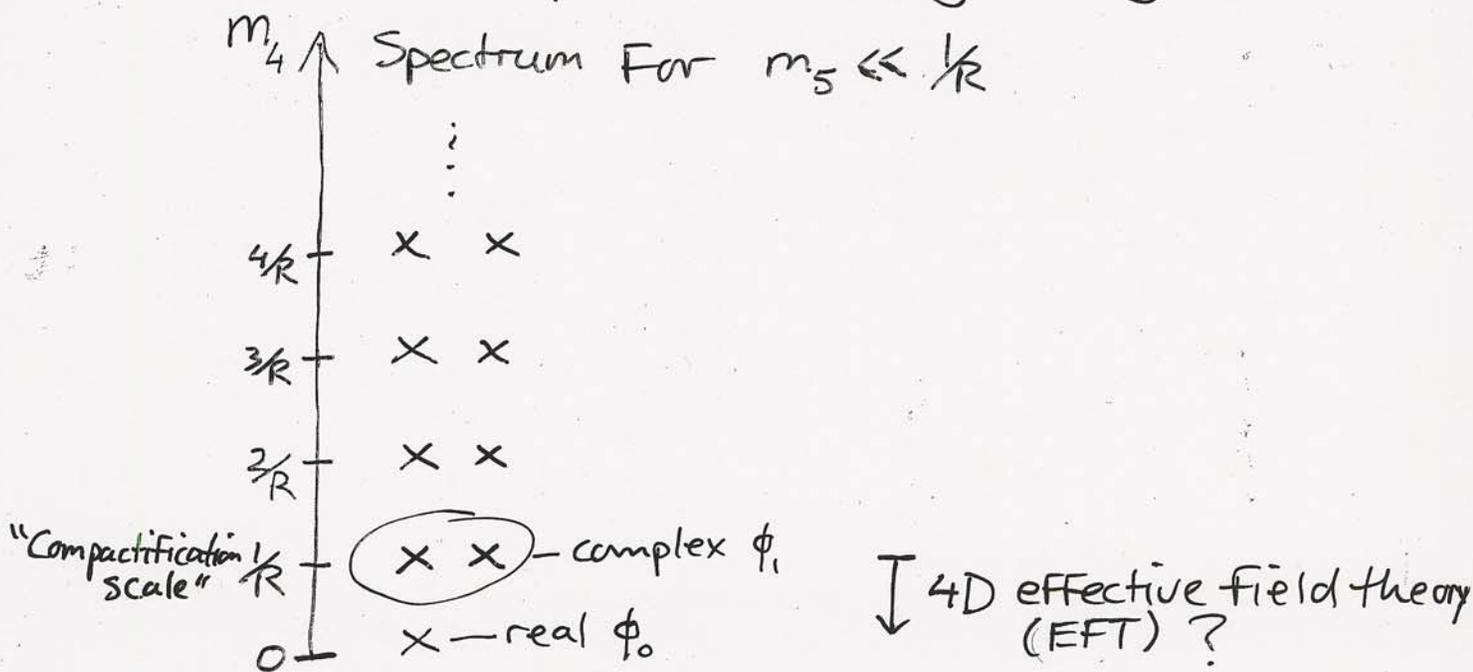

where $\phi_{n < 0}(x) \equiv \phi_{-n}^*(x)$ for convenience.

$\therefore \phi(x, \theta) \equiv \infty$ 4D fields, mostly very massive,

$$m_n^2 = \frac{n^2}{R^2} + m_5^2 \quad n > 0 \equiv \text{"Kaluza-Klein (KK) excitations"}$$

XD symmetry of circle

$\xrightarrow{\text{4D}}$ internal symmetry, ϕ_n
"KK" decomposition having charge n .

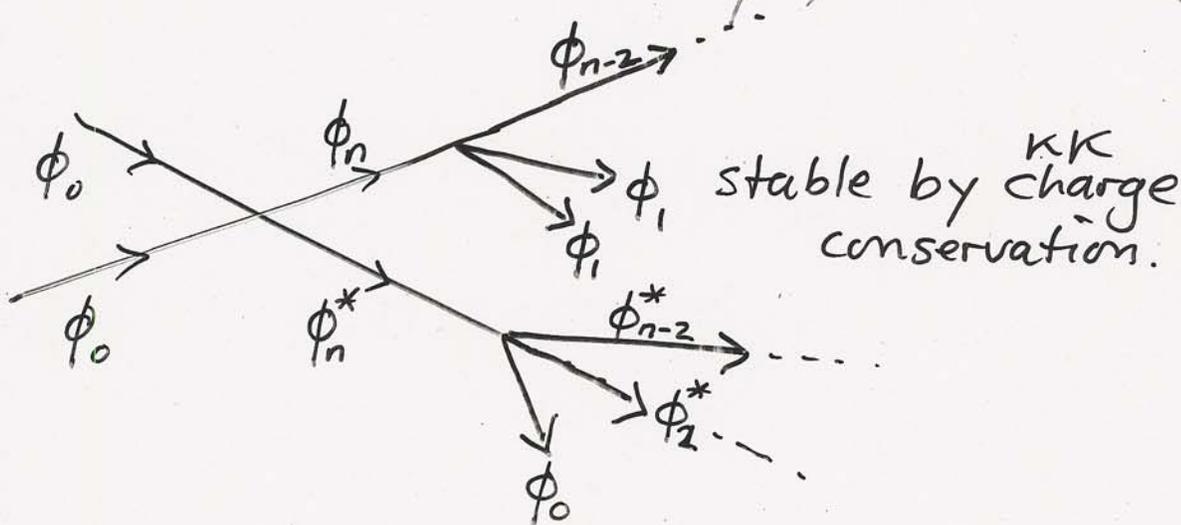

$$\mathcal{L}_{4D, \text{eff}} = \frac{1}{2} (\partial_\mu \phi_0)^2 - \frac{m_{4D}^2}{2} \phi_0^2 - \lambda_{4D} \phi_0^4 + \mathcal{O}(E^2 R^2)$$

$$m_{4D}^2 = m_5^2$$

$$\lambda_{4D} = \frac{\lambda_5}{2\pi R} + \text{loop-level corrections}$$

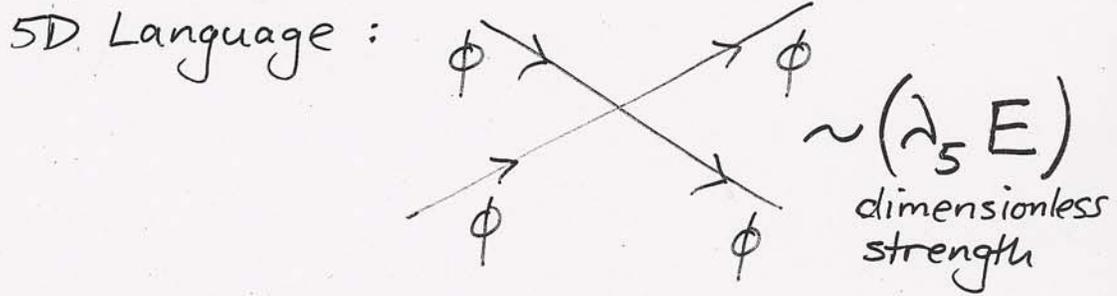

$$[\text{length}] = [\sqrt{\text{Energy}}]$$

Collider Discovery, $E \gg 1/R$

XD misbehave in UV

In UV, R irrelevant:

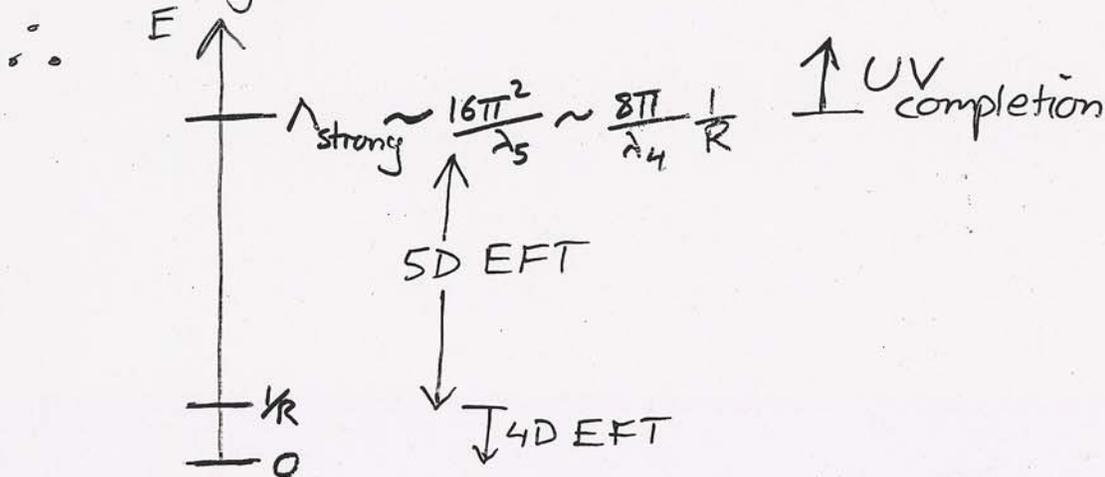

Perturbation theory, & any sensible interpretation, breaks down when

$$\frac{\lambda_5 E}{16\pi^2} \gg 1$$

← phase space considerations

unless theory drastically modified in this regime.

Unifying Spins

5D SU(2) Yang-Mills compactified

$$\mathcal{L}_5 = -\frac{1}{4} G_{MN}^a G^{MN} \quad \substack{a=1,2,3 \\ \text{isospin}}$$

$$= -\frac{1}{4} G_{\mu\nu}^a G^{\mu\nu} - \frac{1}{2} G_{\mu 5} G^{\mu 5},$$

$$G_{MN}^a \equiv \partial_M A_N^a - \partial_N A_M^a - g_5 \epsilon^{abc} A_M^b A_N^c$$

4D low-energy fluctuations:

$$A_M(x, \theta) = \frac{A_M^{(0)}(x)}{\sqrt{2\pi R}} + \frac{\cancel{(A_M^{(1)}(x) e^{i n \theta} + \text{c.c.})}}{\sqrt{2\pi R}}$$

$$\Rightarrow G_{\mu\nu}^a = \partial_\mu A_\nu^{(0)} - \partial_\nu A_\mu^{(0)} - \frac{g_5}{\sqrt{2\pi R}} \epsilon^{abc} A_\mu^b A_\nu^c$$

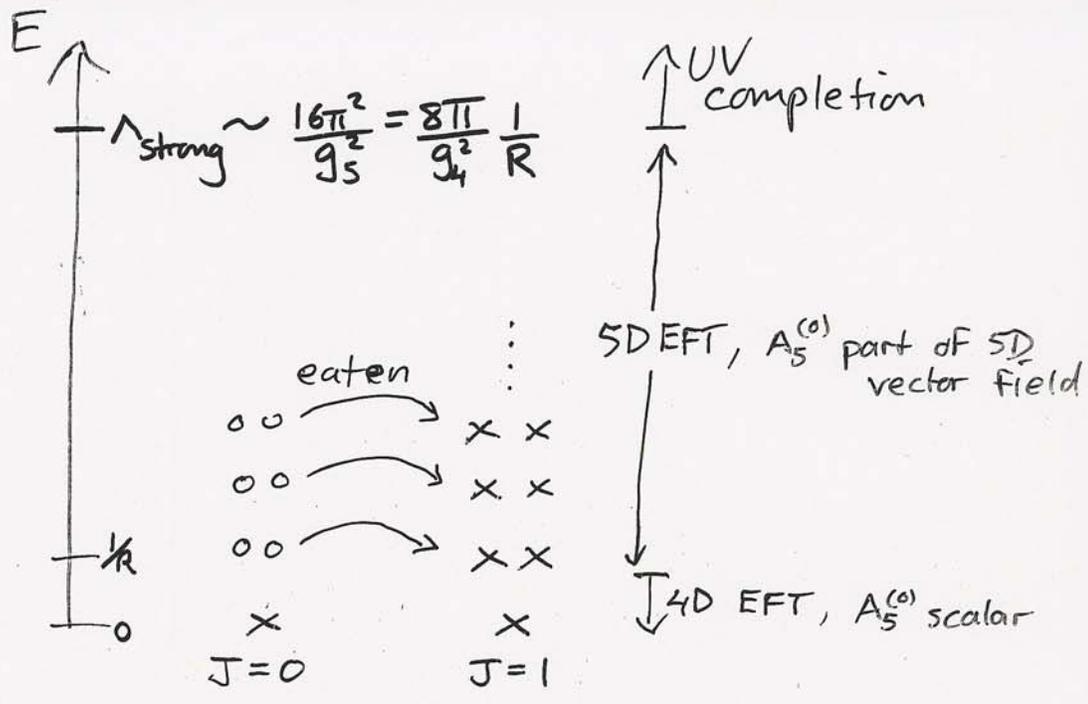

$$G_{\mu 5}^a = \partial_\mu A_5^{(0)a} - \frac{g_5}{\sqrt{2\pi R}} \epsilon^{abc} A_\mu^{(0)b} A_5^{(0)c}$$

4D scalar!

$$\equiv D_\mu A_5^{(0)}$$

$$\Rightarrow \mathcal{L}_{4\text{eff}} = -\frac{1}{4} G_{\mu\nu}^{(0)a} G^{\mu\nu(0)a} + \frac{1}{2} (D_\mu A_5^{(0)})^2$$

$$g_{4\text{eff}} \equiv \frac{g_5}{\sqrt{2\pi R}}$$

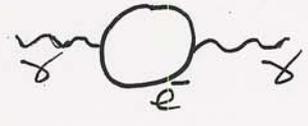

Usual Hierarchy Problem of 4D scalars (Higgs)

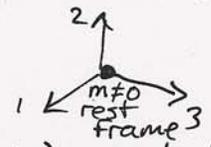

J=0: $\Rightarrow \delta_{QM} m_H^2 \sim \frac{g_4^2}{16\pi^2} \Lambda_{UV}^2$
 UV cutoff on calculation

\Rightarrow theory cannot naturally be extrapolated far above m_H^2 .

J=1: Why γ travels at speed of light ($m_\gamma=0$)

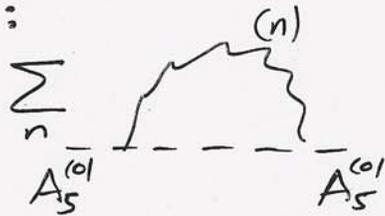

J=1, m=0 has 2 polarizations
 J=1, m≠0 has 3 polarizations

Discrete qualitative effect (Higgs mechanism = superconductivity) need to give mass & add degree of freedom.

$A_5^{(0)}$ From XD:

$$\Rightarrow \delta_{QM} m_{A_5^{(0)}}^2 \sim \frac{g_4^2}{16\pi^2} \left(\frac{1}{R}\right)^2$$

because for $P_{loop} \gg 1/R$,
5D Lorentz invariance recovered
which protects A_M -mass.

XD naturally allow greater separation
of scales

$$\Lambda_{UV} \left(\begin{array}{l} \text{unknown,} \\ \text{dangerous} \\ \text{physics} \end{array} \right) : m_H \left(\begin{array}{l} \sim \text{weak} \\ \text{scale} \end{array} \right)$$

Usual 4D scalar: $\frac{\Lambda_{UV}}{m_H} \sim \text{naturally } \frac{4\pi}{g_4}$

$A_5^{(0)}$ scalar: $\frac{\Lambda_{strong}}{m_{A_5}^{(0)}} \sim \text{naturally } \underbrace{\left(\frac{8\pi}{g_4^2}\right) \left(\frac{4\pi}{g_4}\right)}_{\text{Winning}}$

[Winning are lower when all realistic
properties of Higgs realized, but still
useful.]
