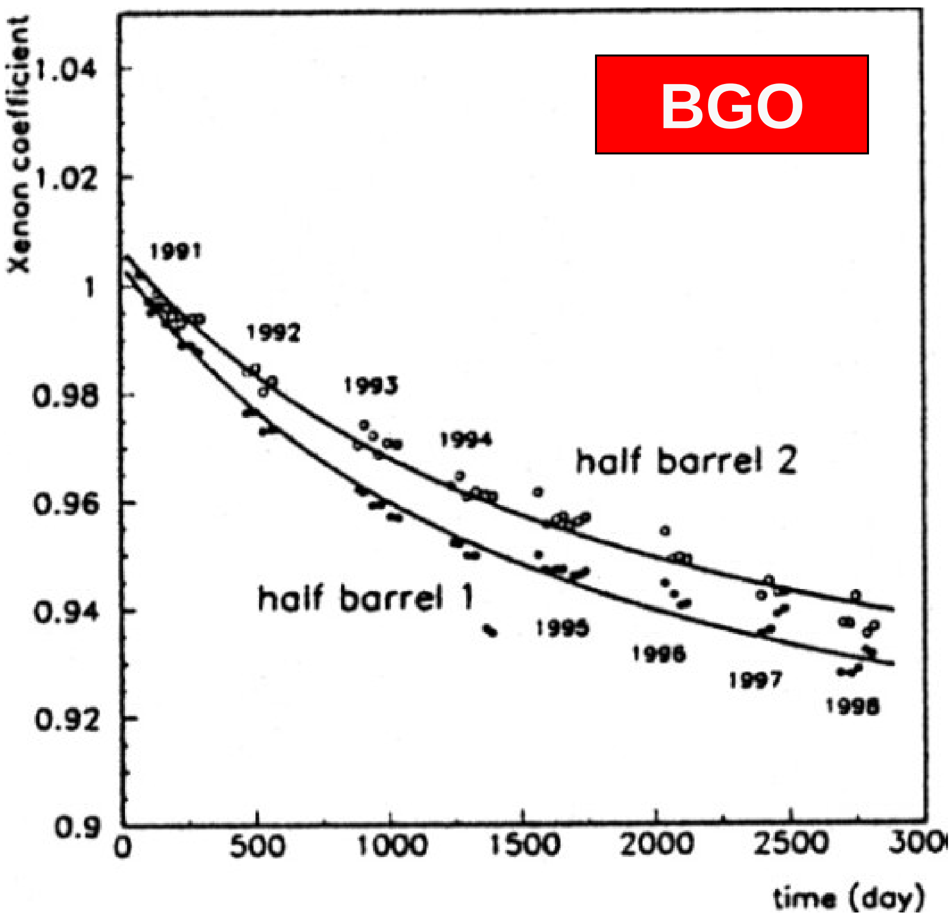
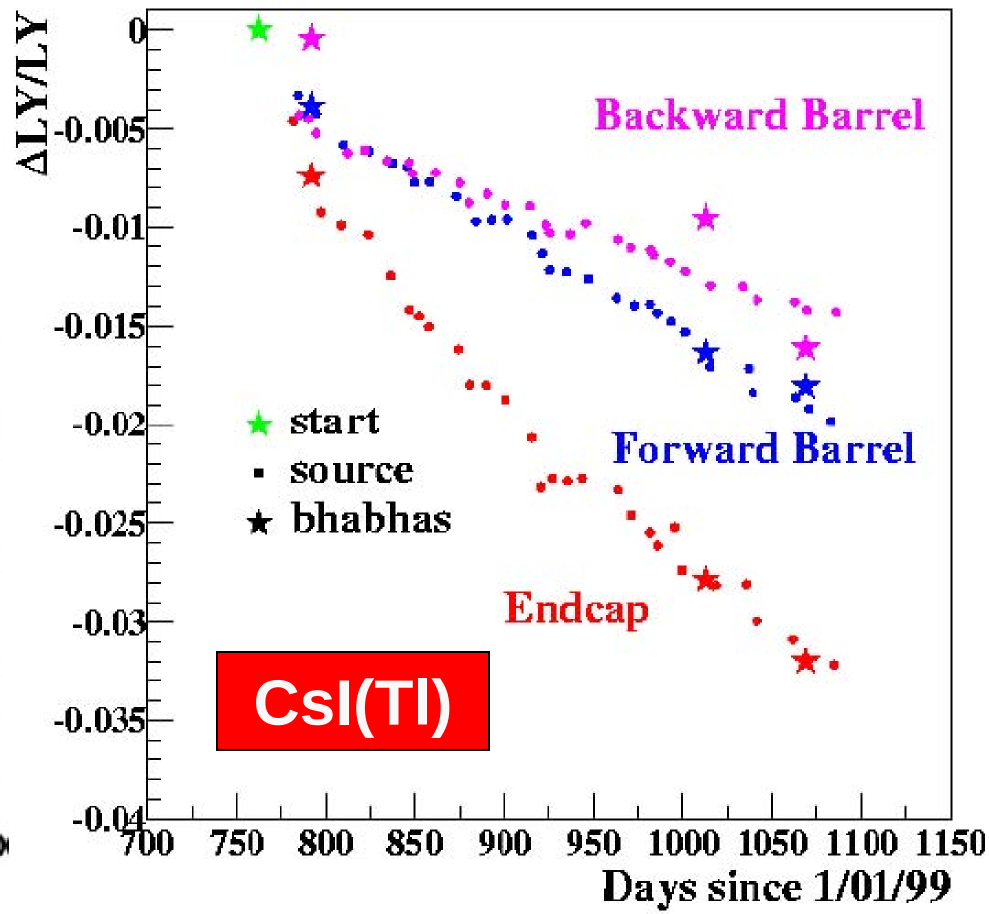
BaBar CsI(Tl): 1 - 3 % per year





Effects of Radiation Damage

- Induced absorption caused by color center formation:
  - reduced light attenuation length and thus light output, and maybe
  - degraded of light response uniformity (LRU).
- Induced phosphorescence:
  - increase readout noise.
- Reduced scintillation light yield:
  - reduce light output and degrade light response uniformity.

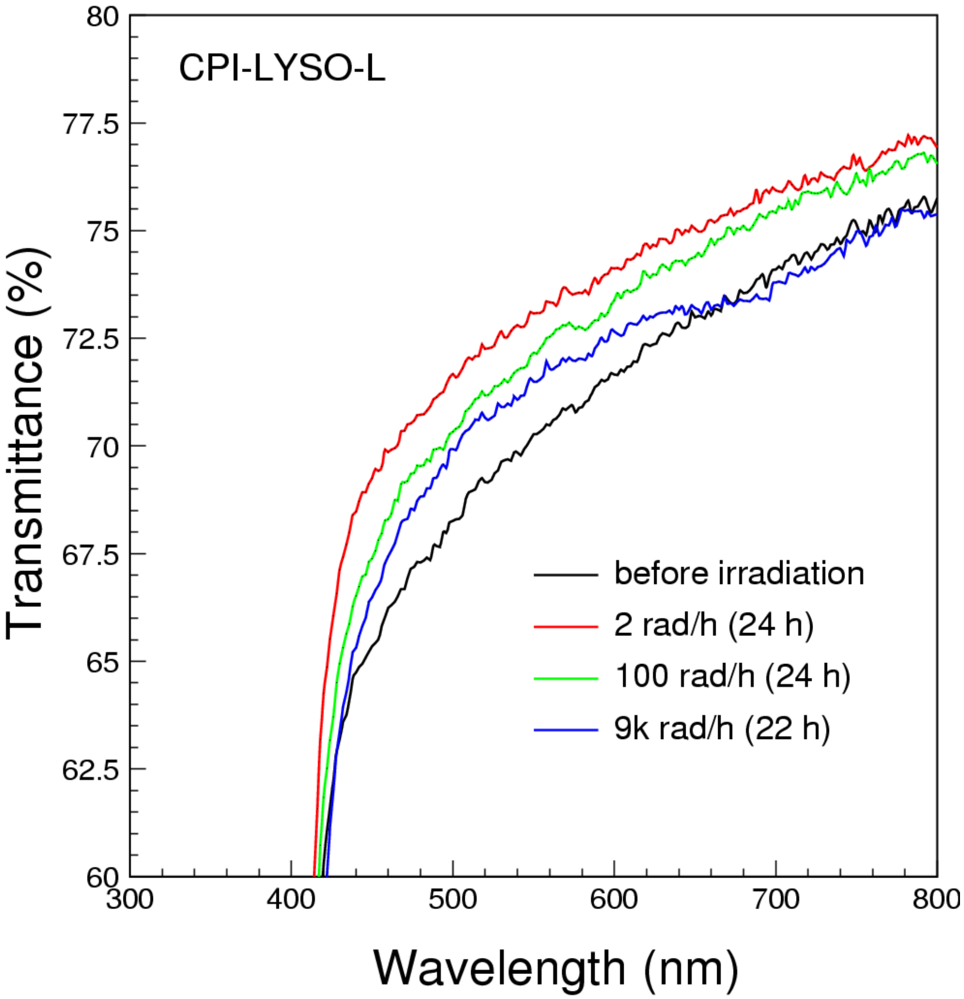
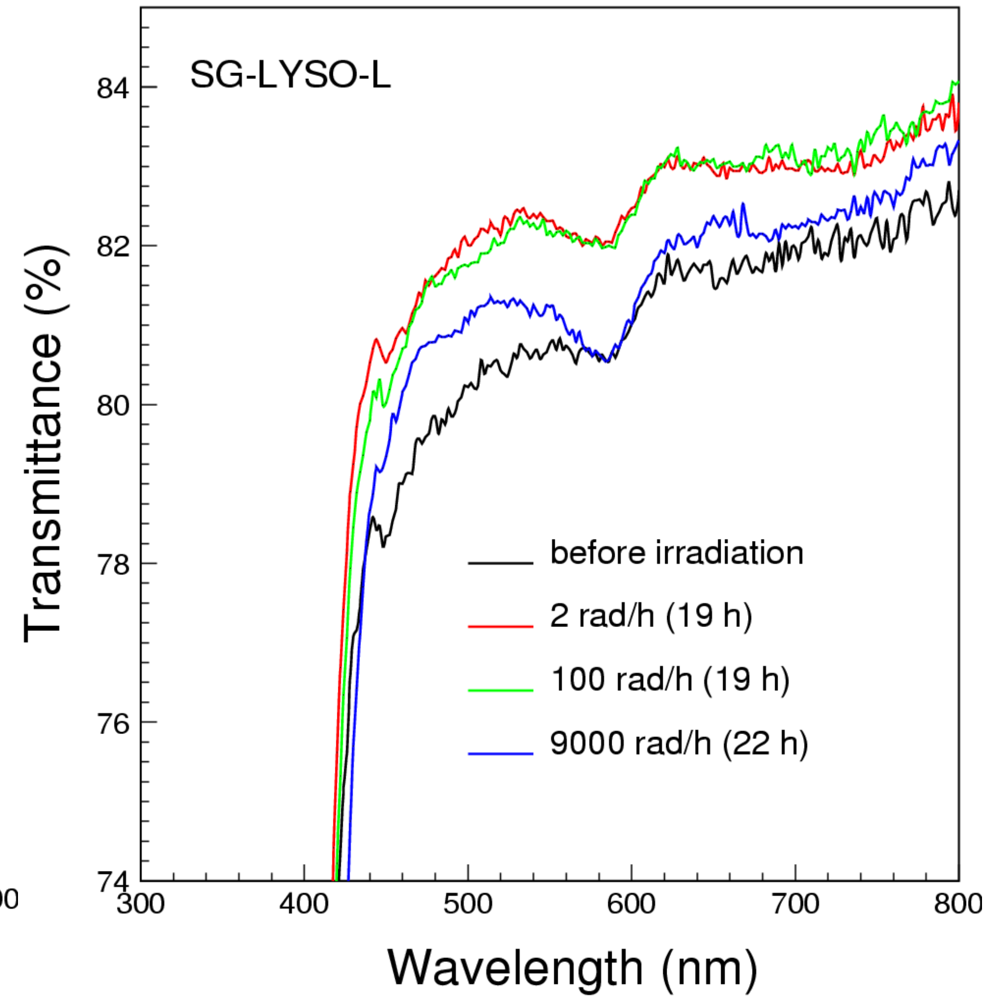
LYSO Transmittance Damage

LT @ 430 nm shows 6 and 3% increase under 2 rad/h, followed by 6 and 5% degradation under 9 krad/h for CPI and SG samples respectively





LSO/LYSO ECAL Performance

- Less demanding to the environment because of small temperature coefficient.
- Radiation damage is less an issue as compared to the CMS PWO ECAL.
- A better energy resolution, $\sigma(E)/E$, at low energies than L3 BGO and CMS PWO because of its high light output and low readout noise:

$$2.0\% / \sqrt{E} \oplus 0.5\% \oplus .001/E$$

Summary

- Because of total absorption, precision crystal calorimetry provides the best possible energy and position resolutions for electrons and photons as well as good e/γ identification and reconstruction efficiencies.
- Progress has been made in understanding crystal radiation damage and improving qualities of mass produced crystals.
- An LSO/LYSO crystal calorimeter will provide excellent energy resolution over a large dynamic range down to MeV level for future HEP and NP experiments.

LAL affects LRU

Nucl. Instr. And Meth. A413 (1998) 297

Ray-Tracing simulation for CMS PWO crystals shows no change in LRU if LAL is longer than 3.5 crystal length

Light collection efficiency, fit to a linear function of distance to the small end of the crystal, was determined with two parameters: the light collection efficiency at the middle of the crystal and the uniformity.

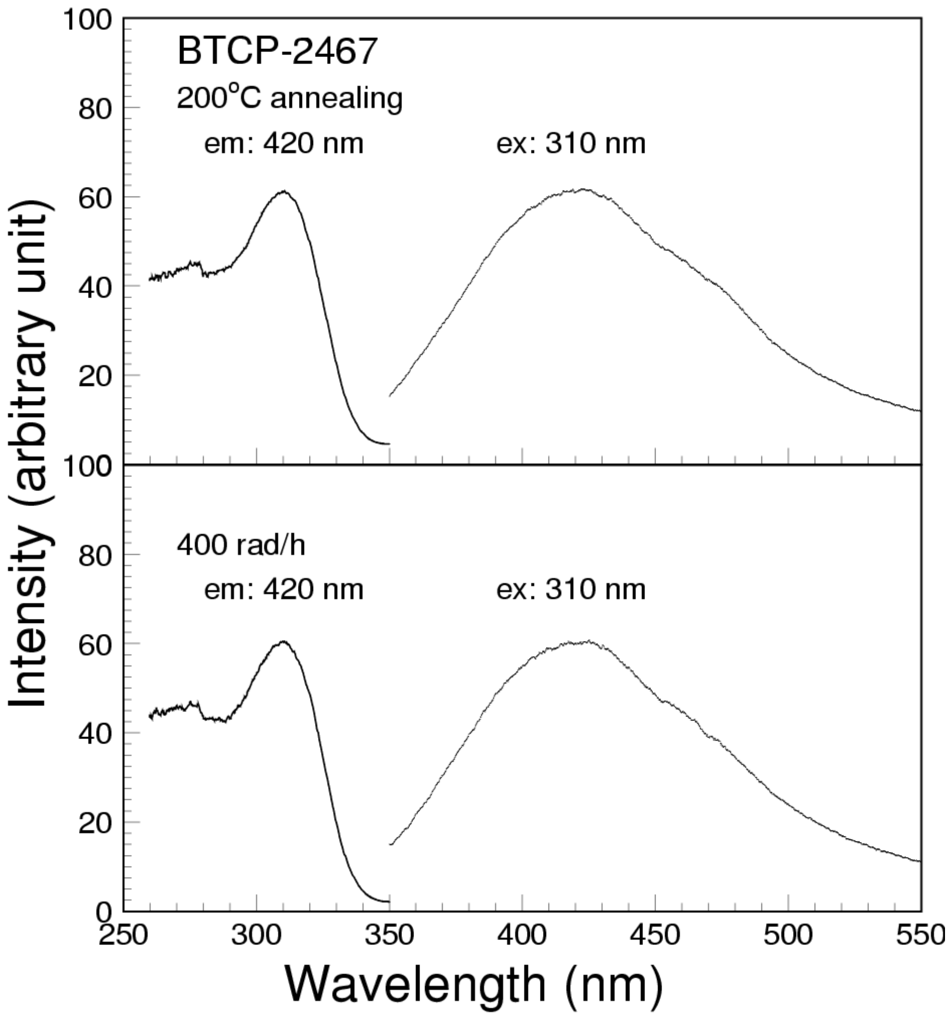
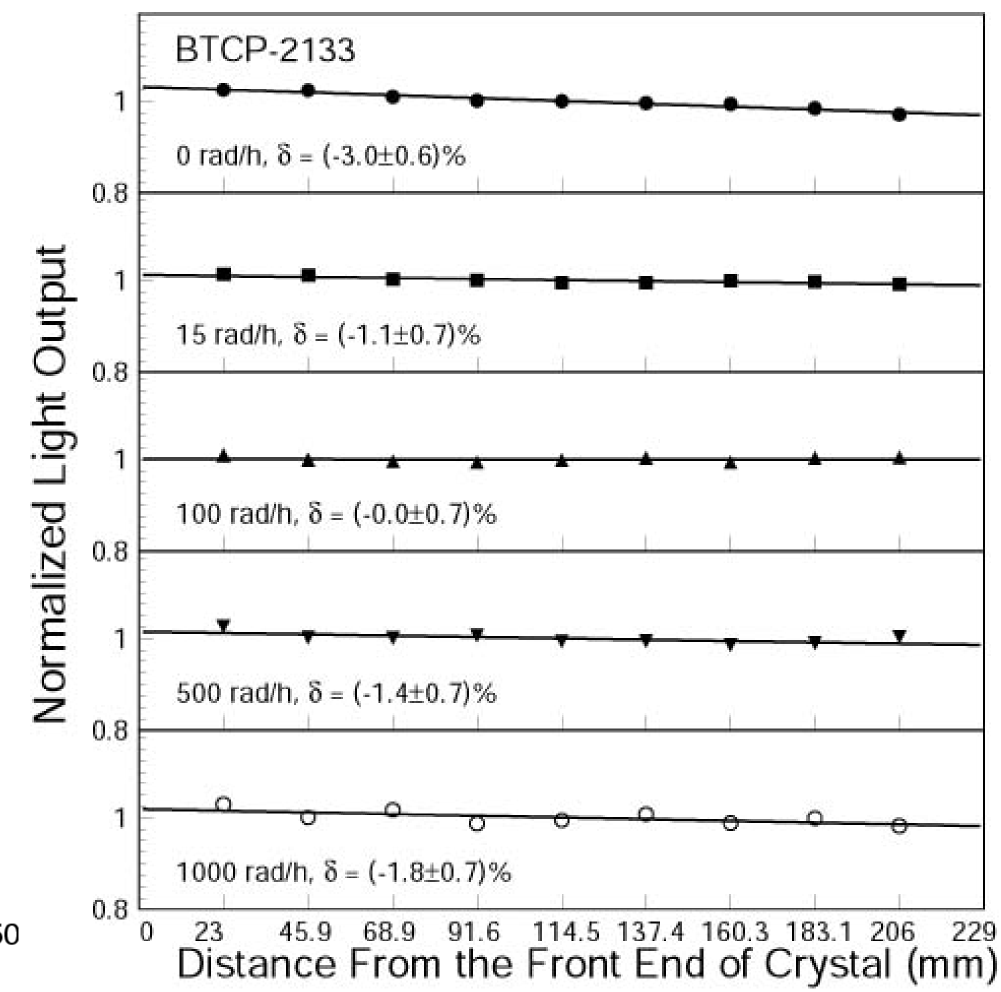
PWO Radiation Damage

No damage in scintillation mechanism

No damage in resolution if light attenuation length > 1 m





Dose Rate Dependence

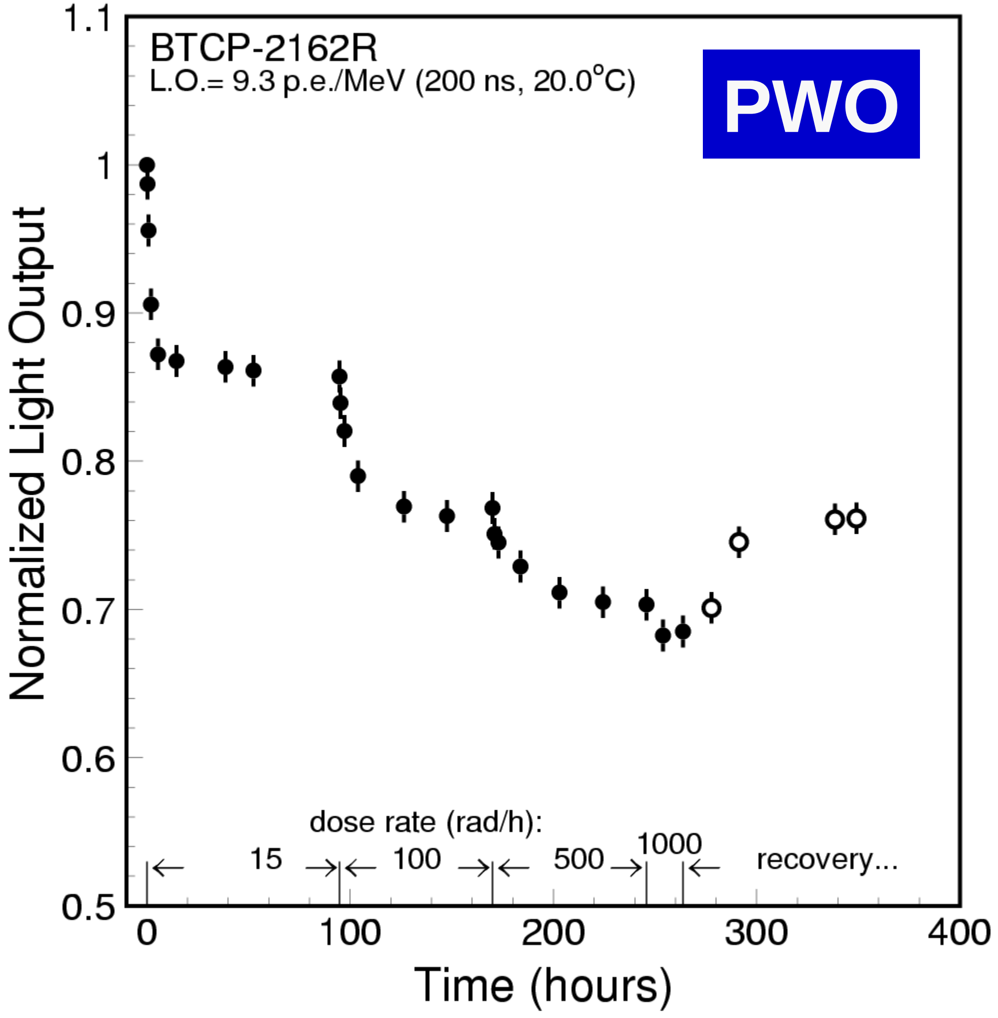
IEEE Trans. Nucl. Sci., Vol. 44 (1997) 468-476

$$dD = \sum_{i=1}^{n} \{-a_i D_i dt + (D_i^{all} - D_i)\, b_i R dt\}$$

$$D = \sum_{i=1}^{n} \{\frac{b_i R D_i^{all}}{a_i + b_i R}[1 - e^{-(a_i+b_iR)t}] + D_i^0 e^{-(a_i+b_iR)t}\}$$

- D_i: color center density in units of m^{-1};
- D_i^0: initial color center density;
- D_i^{all} is the total density of trap related to the color center in the crystal;
- a_i: recovery costant in units of hr^{-1};
- b_i: damage contant in units of kRad^{-1};
- R: the radiation dose rate in units of kRad/hr.

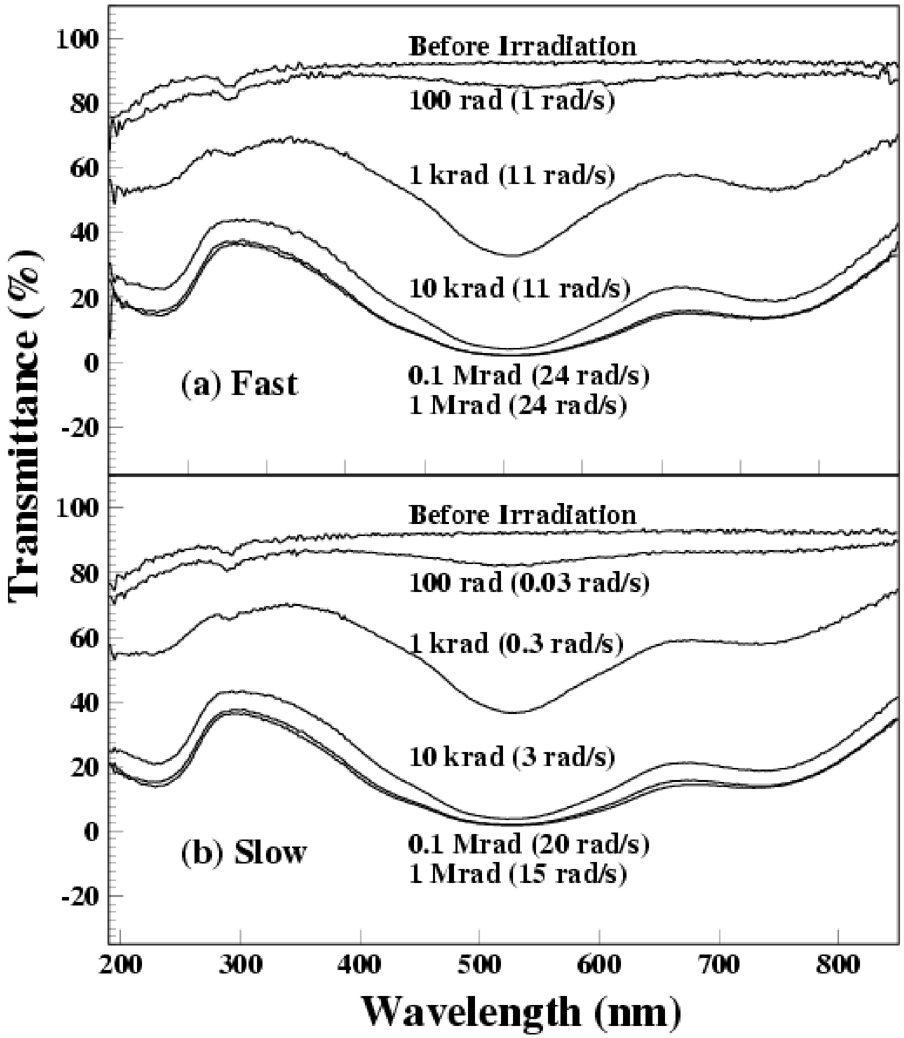
$$D_{eq} = \sum_{i=1}^{n} \frac{b_i R D_i^{all}}{a_i + b_i R}$$



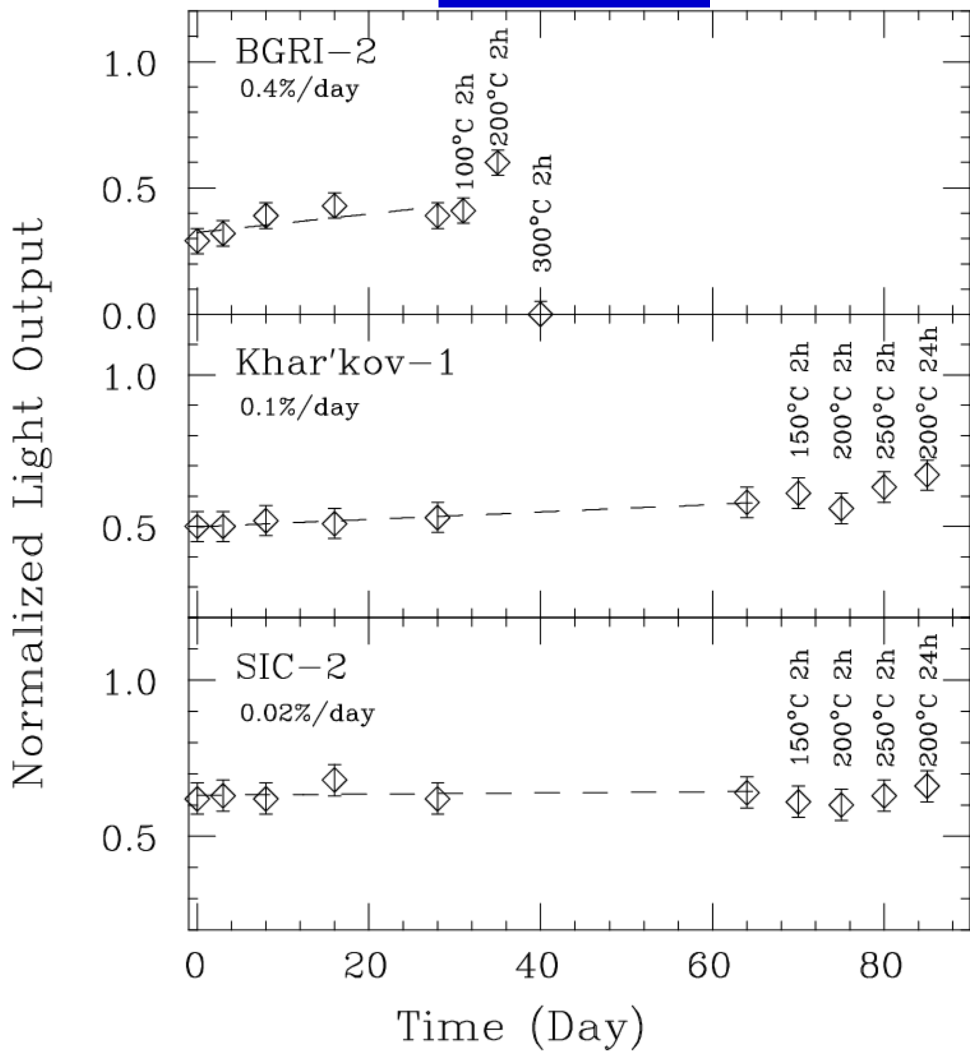
No Dose Rate Dependence

No/slow recovery: no/less dose rate dependence

BaF_2



CsI(Tl)



CsI(Tl) Damage Mechanism

Nucl. Instr. And Meth. A340 (1994) 442

- Oxygen Contamination is known to cause radiation damage for other alkali halide scintillators. In BaF_2, for example, hydroxyl (OH^-) may be introduced into crystal through a hydrolysis process, and latter decomposed to interstitial and substitutional centers by radiation through a radiolysis process: $H_i^0 + O_s^-$ or $H_s^- + O_i^0$, where subscript i and s refer to interstitial and substitutional centers respectively.
- Possible means for trace oxygen identification:
  - Secondary Ionization Mass Spectroscopy (SIMS);
  - Gas Fusion (LEGO); and
  - Energy Dispersive x-Ray (EDX).

PWO Radiation Damage Mechanism

Nucl. Instr. And Meth. A413 (1998) 297

- Crystal defects, such as Oxygen Vacancies, are known to cause radiation damage for other oxide scintillators. In BGO, for example, three common radiation induced absorption bands at 2.3, 3.0 and 3.8 eV were found in a series of 24 doped samples, indicating defect-related color centers.
- Possible means for oxygen vacancy identification:
  - Electron Paramagnetic Resonance (ESR) and Electron-Nuclear Double Resonance (ENDOR);
  - Transmission Electron Microscopy (TEM)/Energy Dispersion Spectrometry (EDS); and
  - A pragmatic way: Oxygen Compensation by Post-Growing Annealing in Oxygen Rich Atmosphere.
