

UNDERSTANDING THE ATMOSPHERE
AS A CALORIMETER
FOR UHE COSMIC RAYS

G. Schatz

Universität Heidelberg

- Hadron calorimeters
- A brief course on Extensive Air Showers (EAS)
- How to observe EASs
- Problems remaining

Quantities characterising a primary cosmic ray particle

direction

position

time

energy

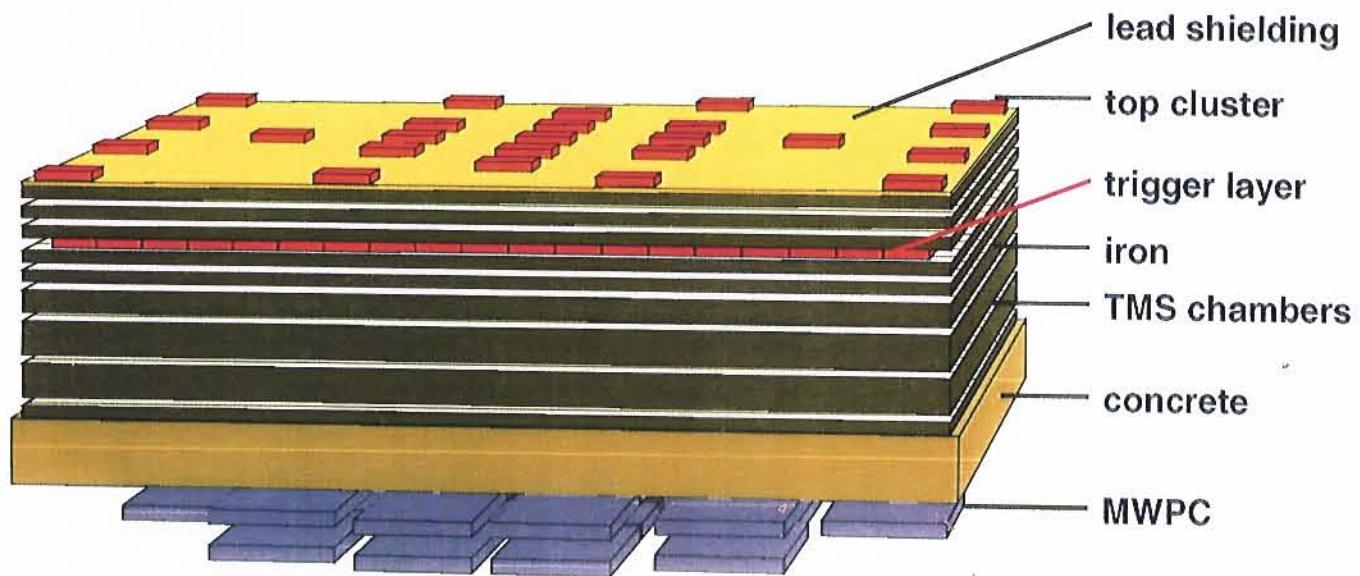

mass

charge

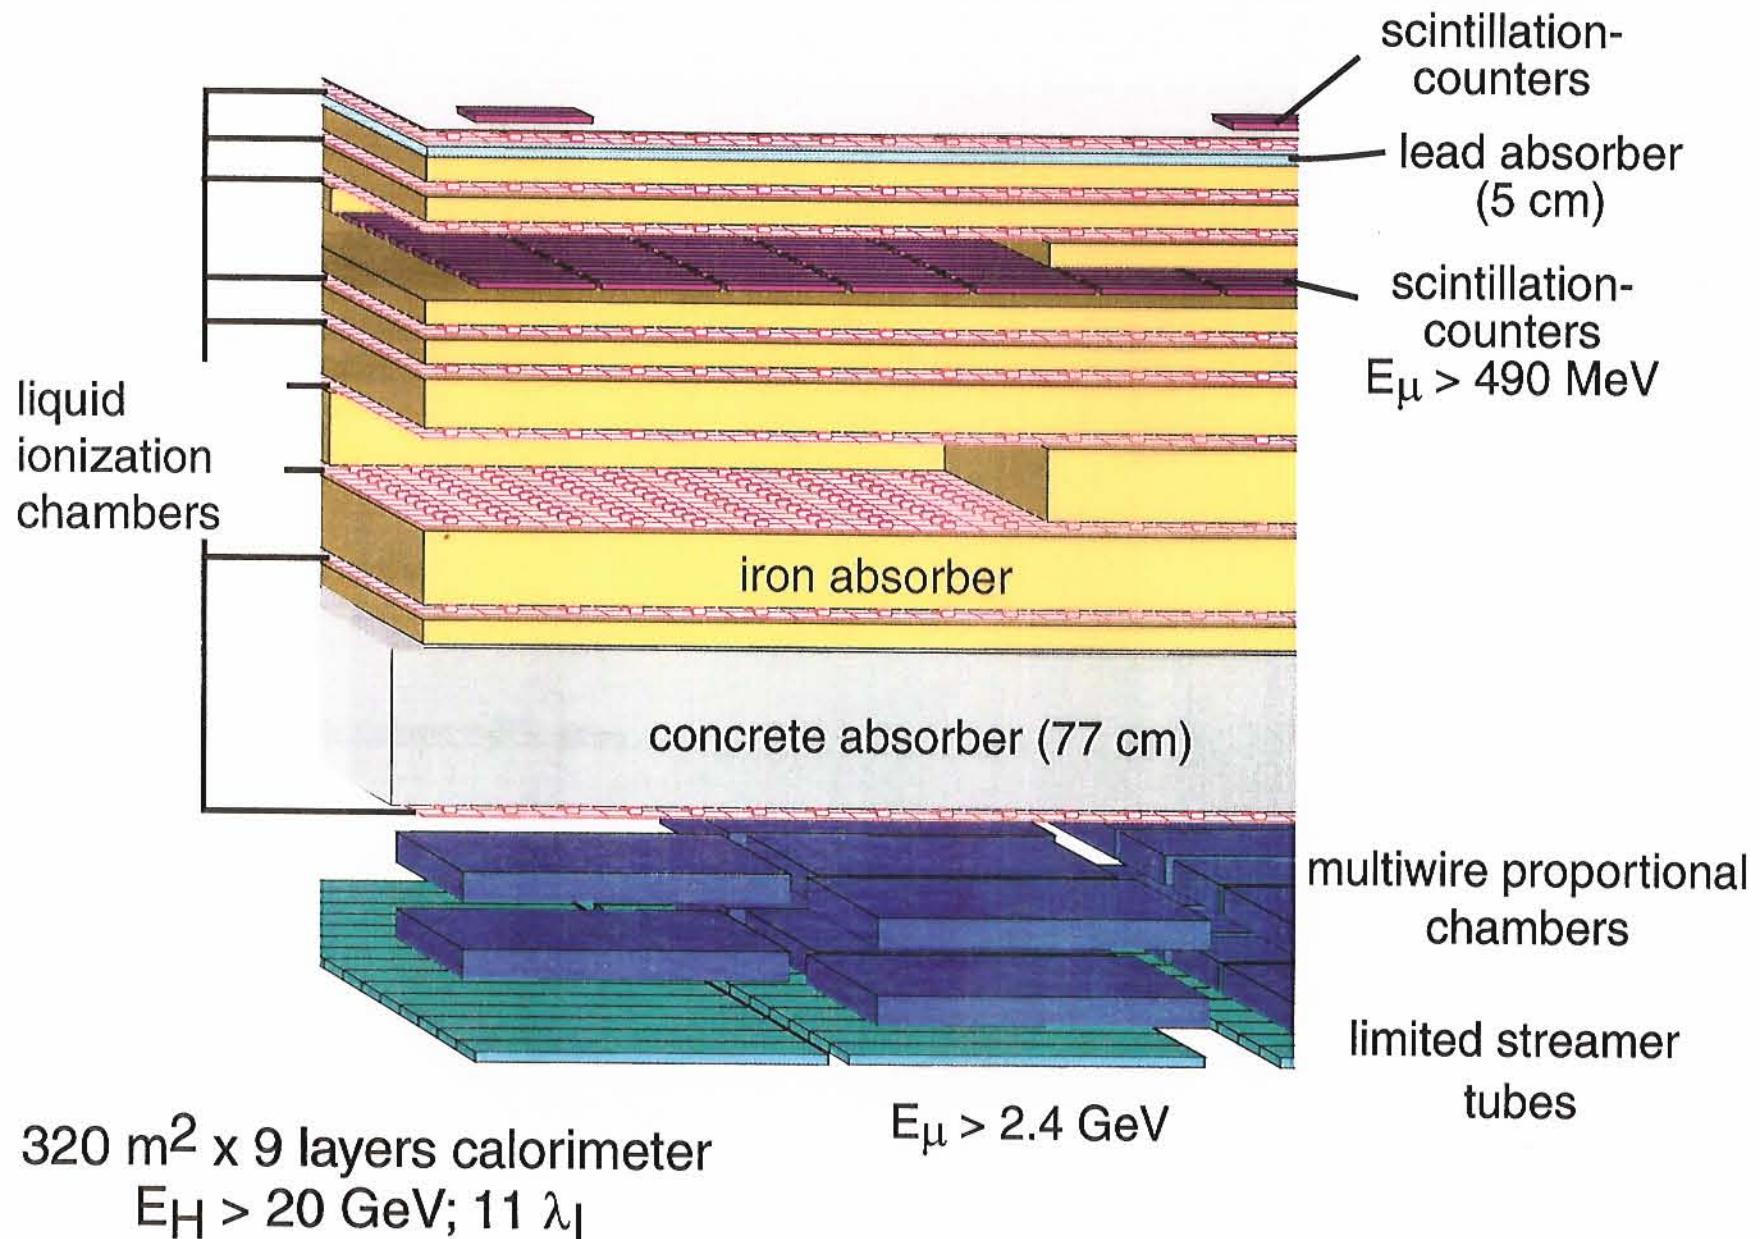

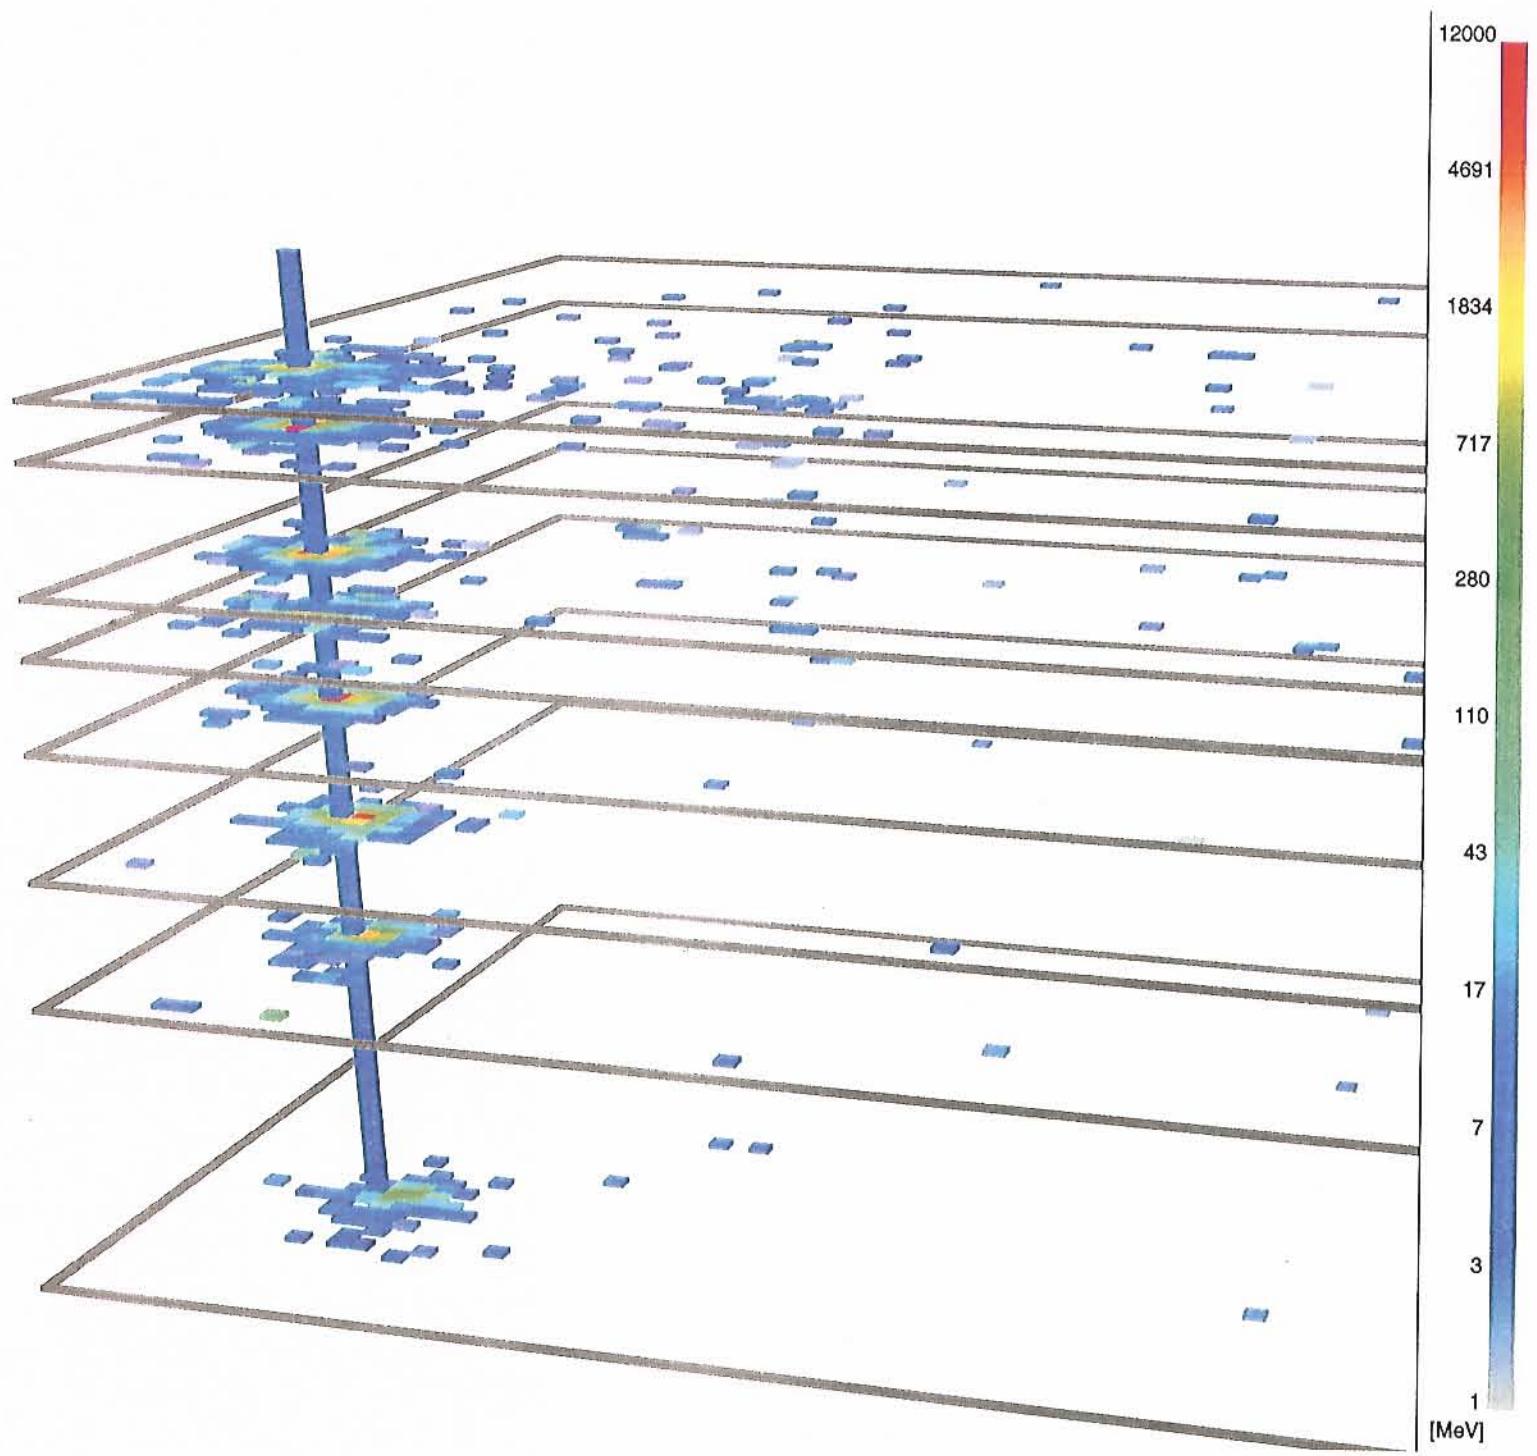

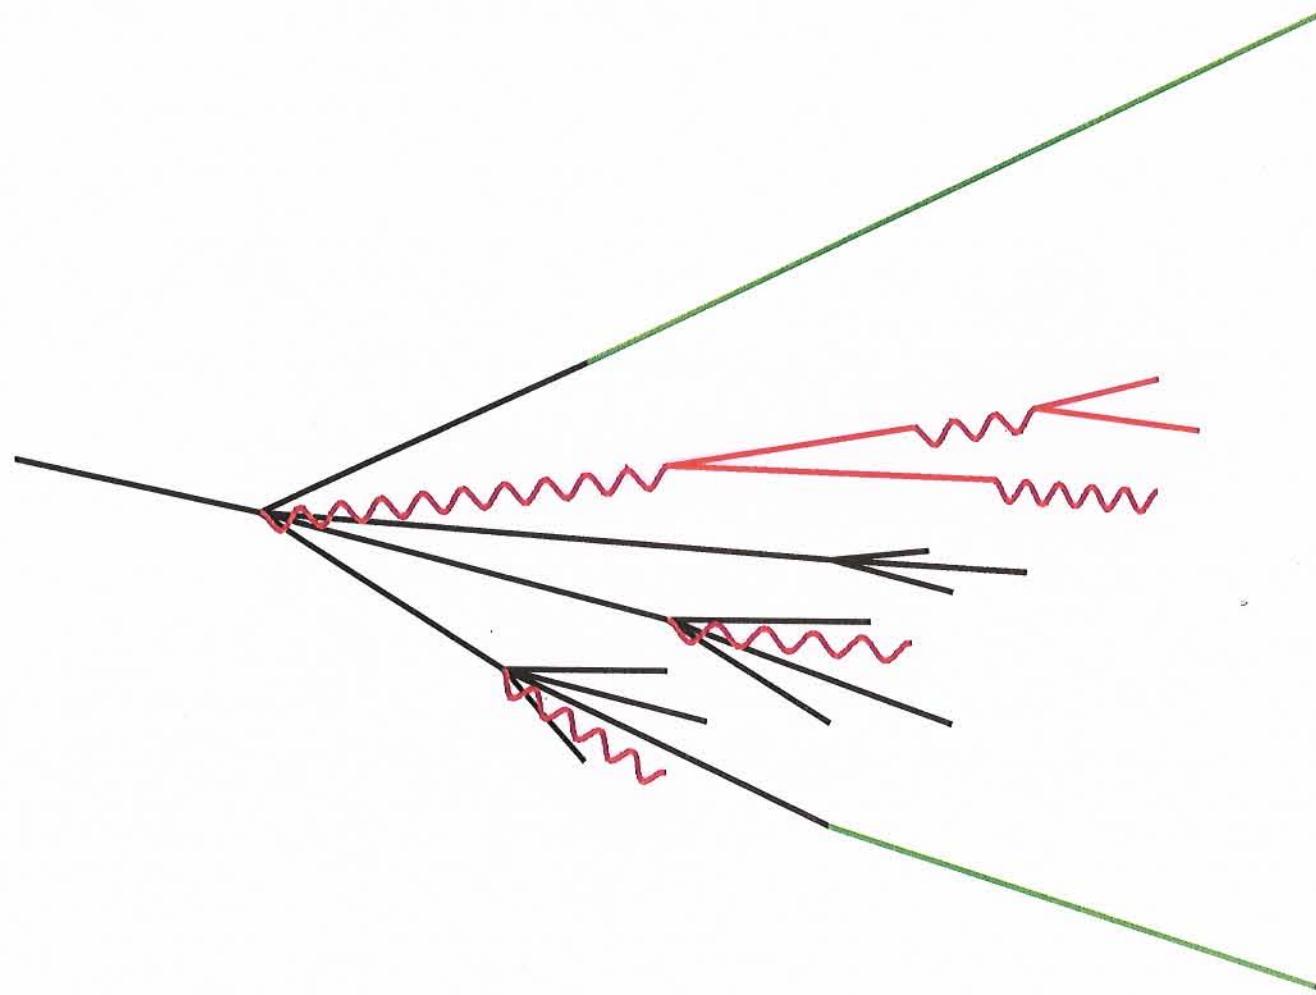

KASCADE Central Detector

Hadron Calorimeter in the KASCADE Experiment

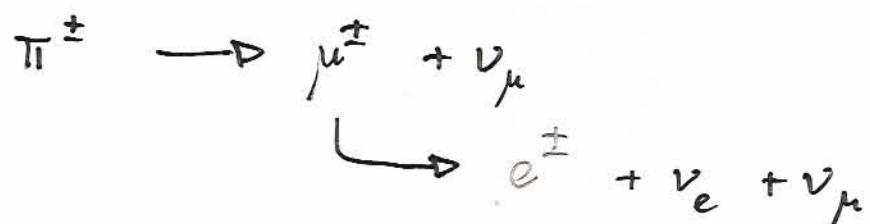

THE MOST IMPORTANT PROCESSES IN EAS

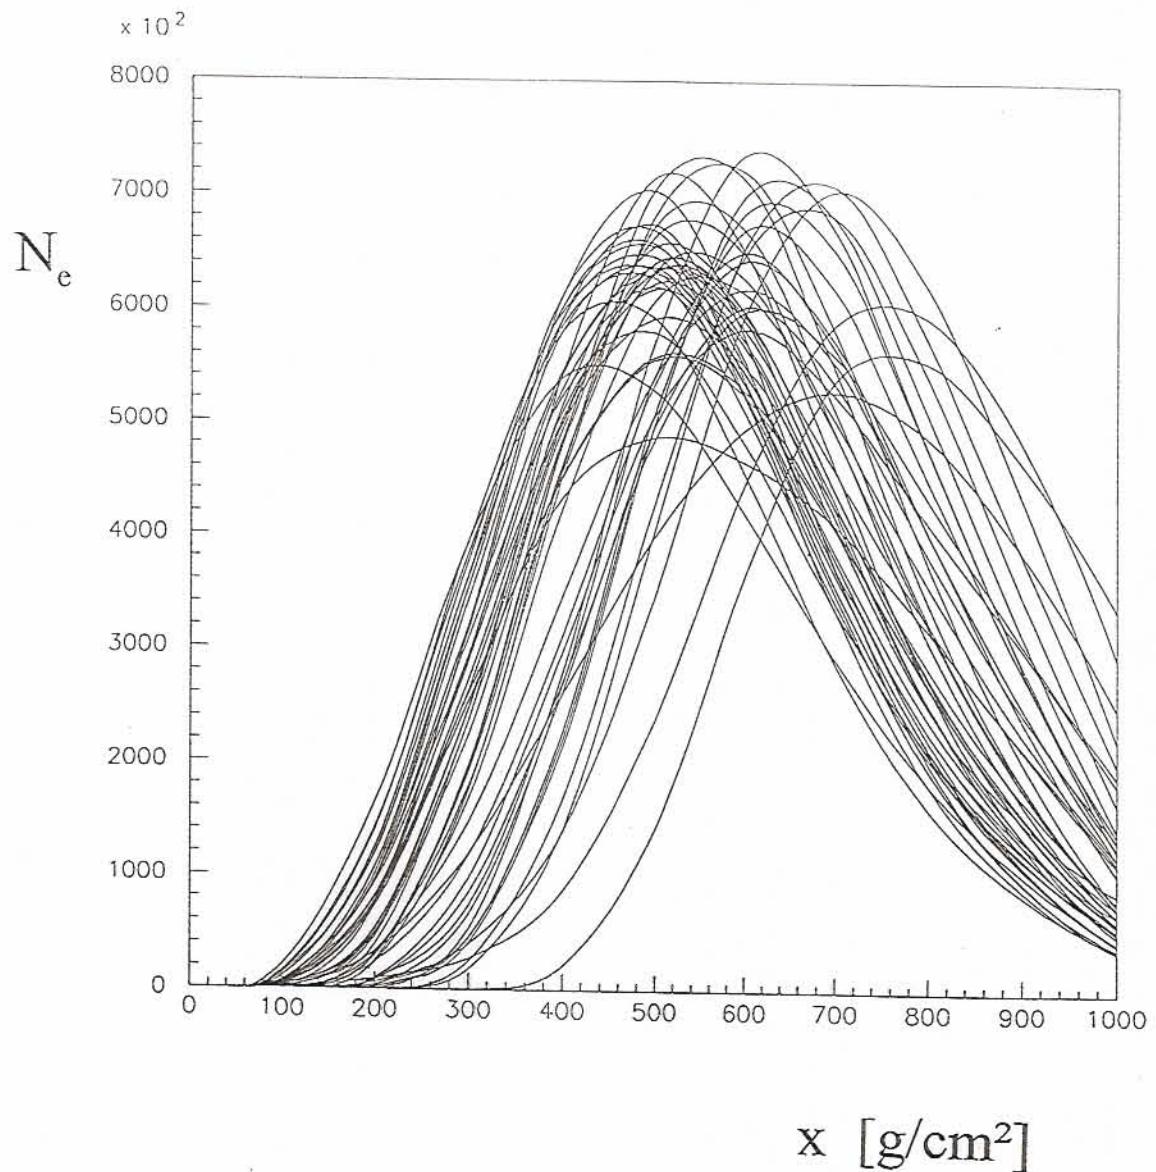

$p + N \rightarrow$ many π s, K s, nucleons . . .

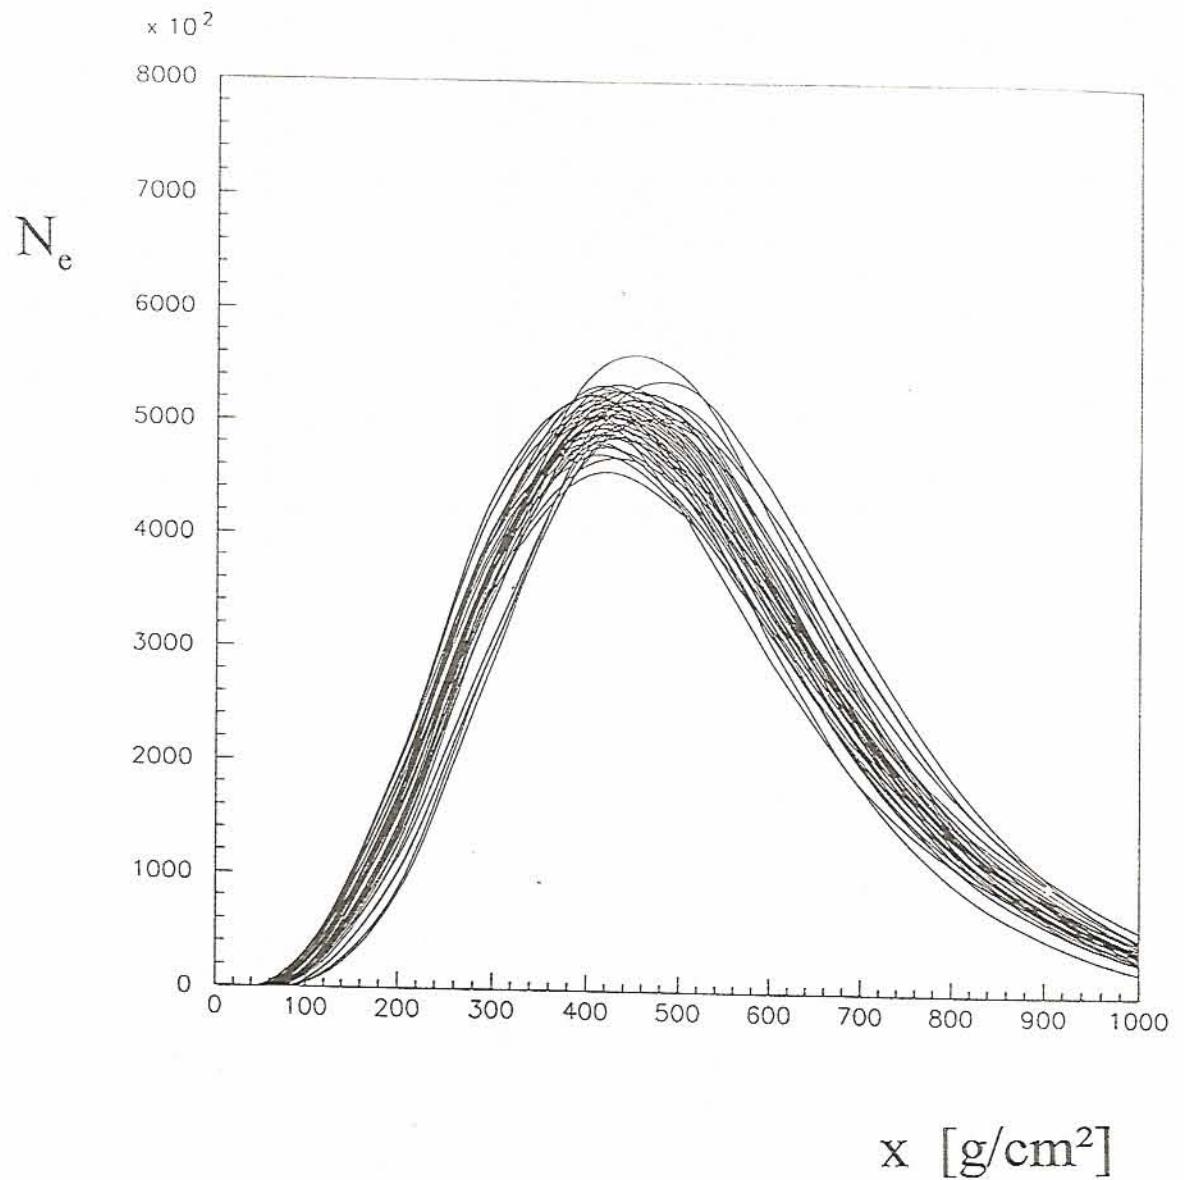

$\pi^\pm + N \rightarrow$ many π s, K s, nucleons . . .

MAIN CHARACTERISTICS OF EAS_s

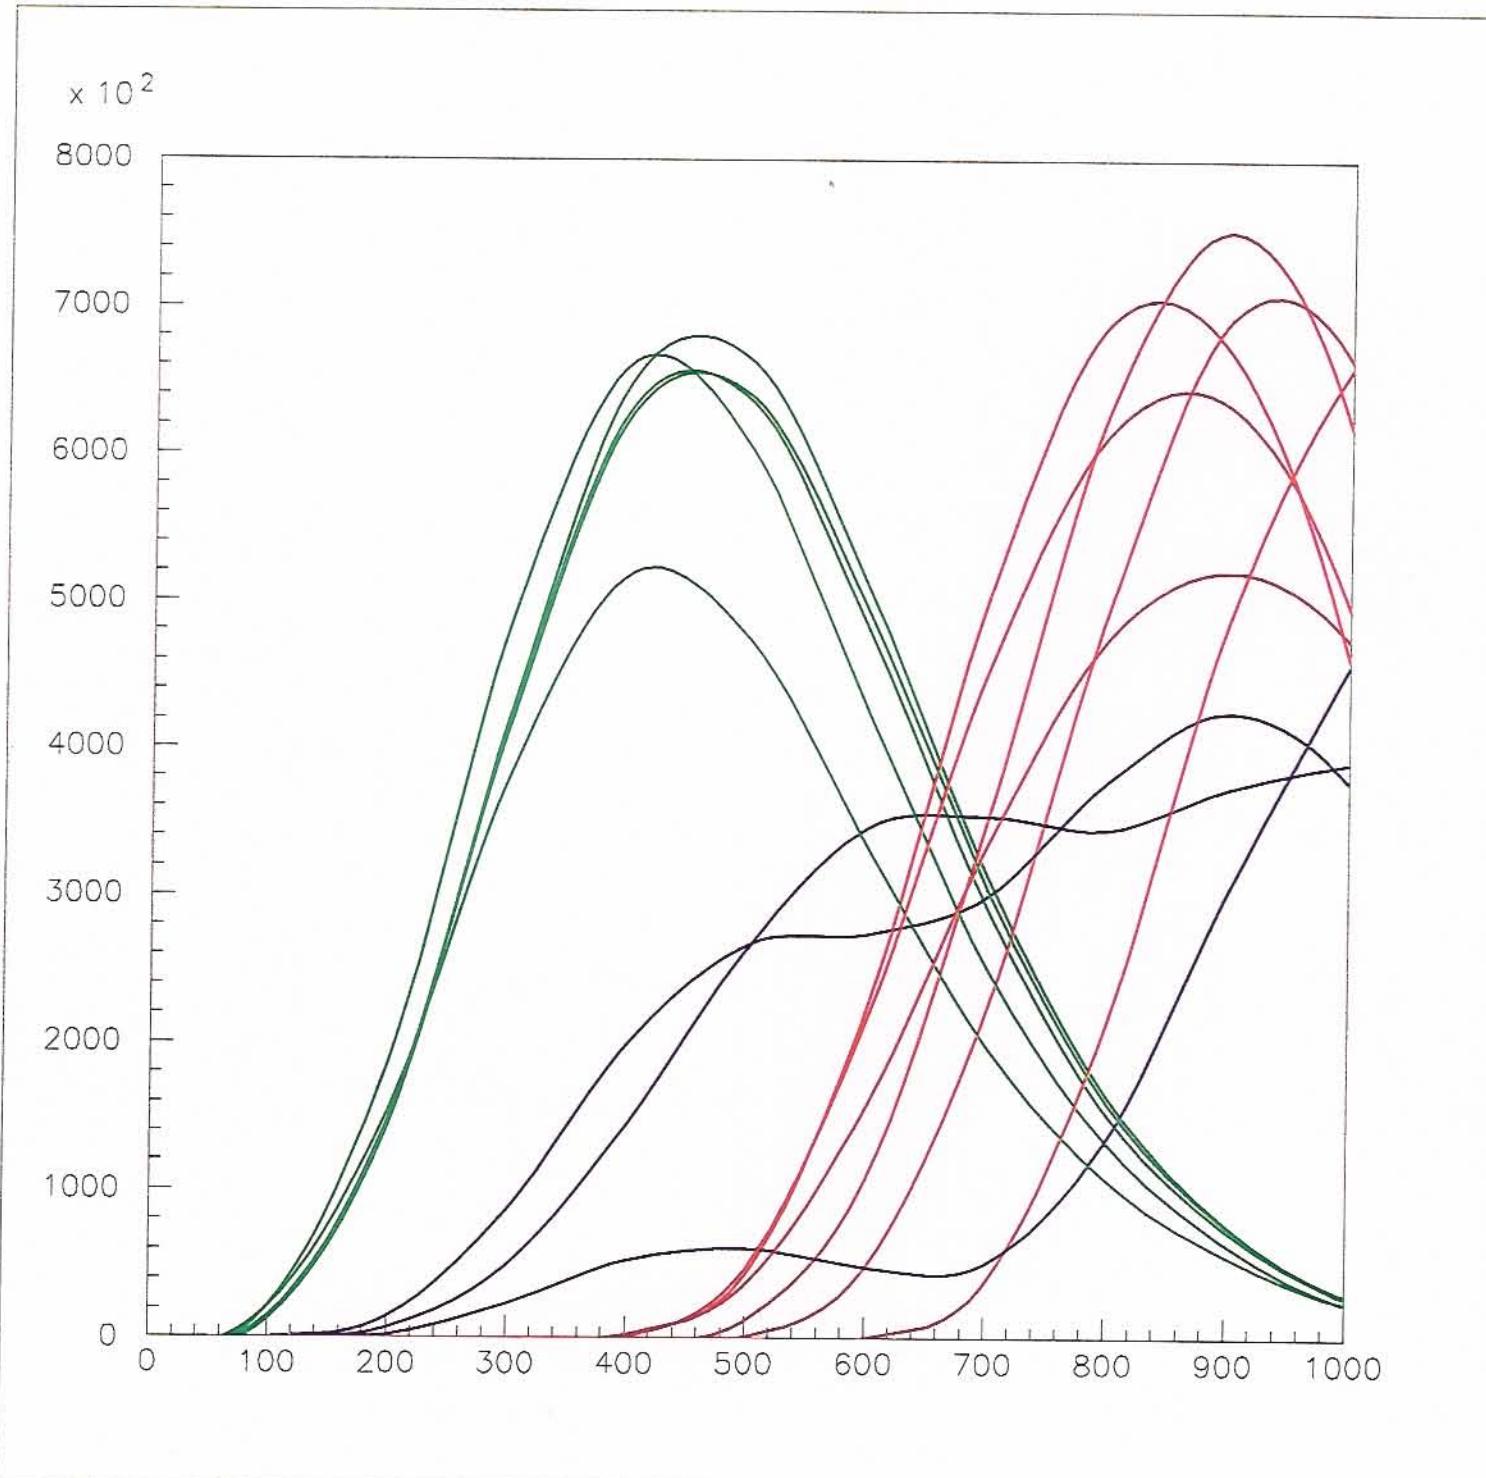

- Complete fragmentation of primary energy
- Energy flows from hadrons to e. m. particles
- Some energy lost due to ν s and μ s
- Huge fluctuations

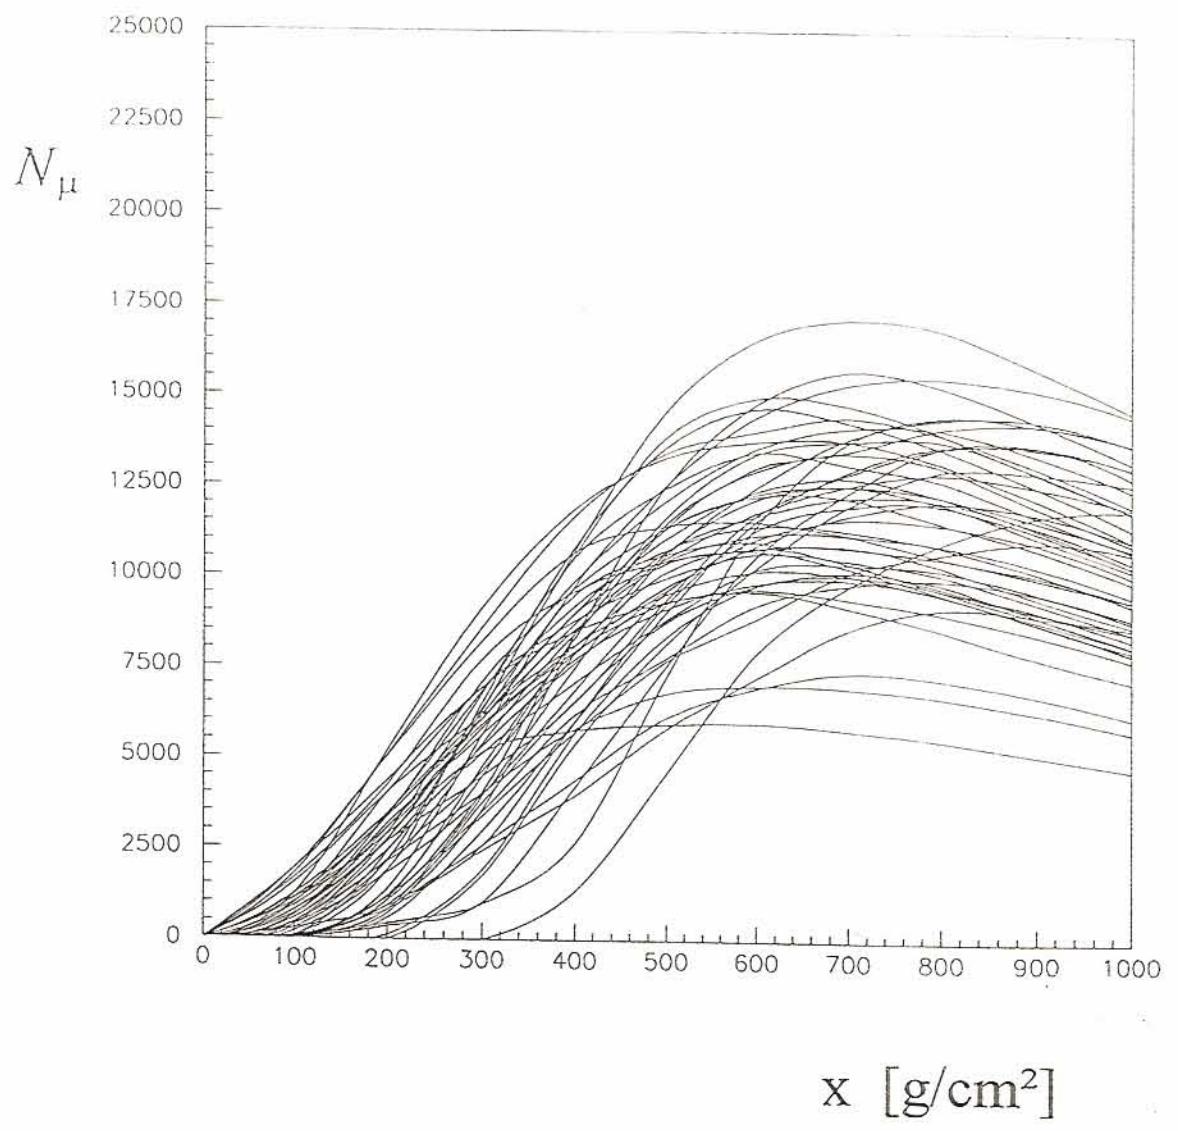

p, 1 PeV, vertical, QGS-NKG

Fe, 1 PeV, vertical, QGS-NKG

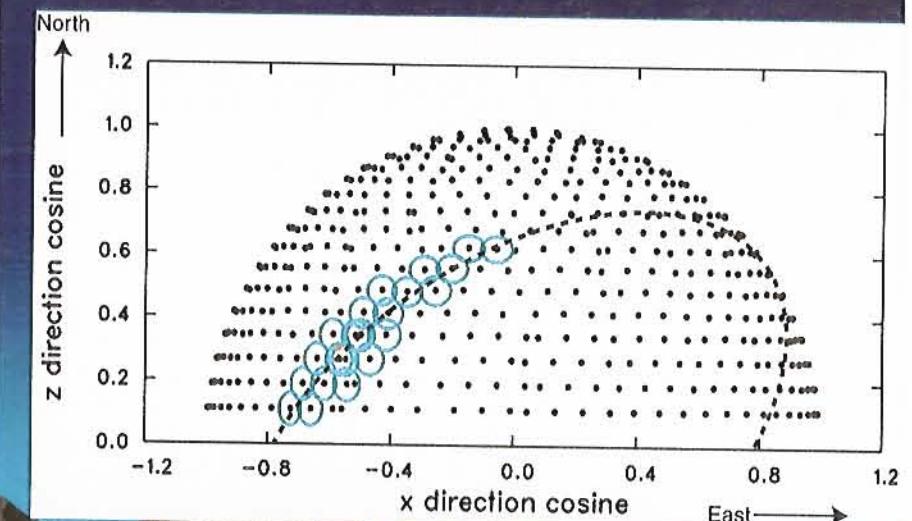

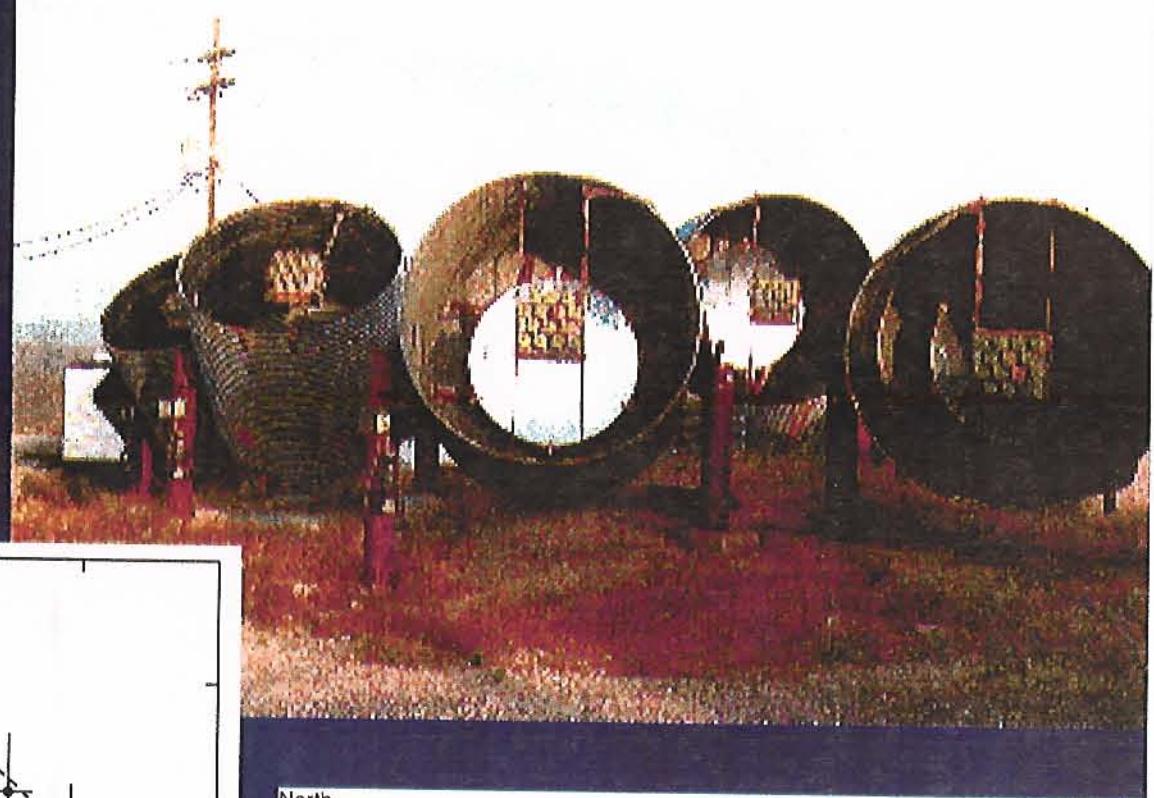

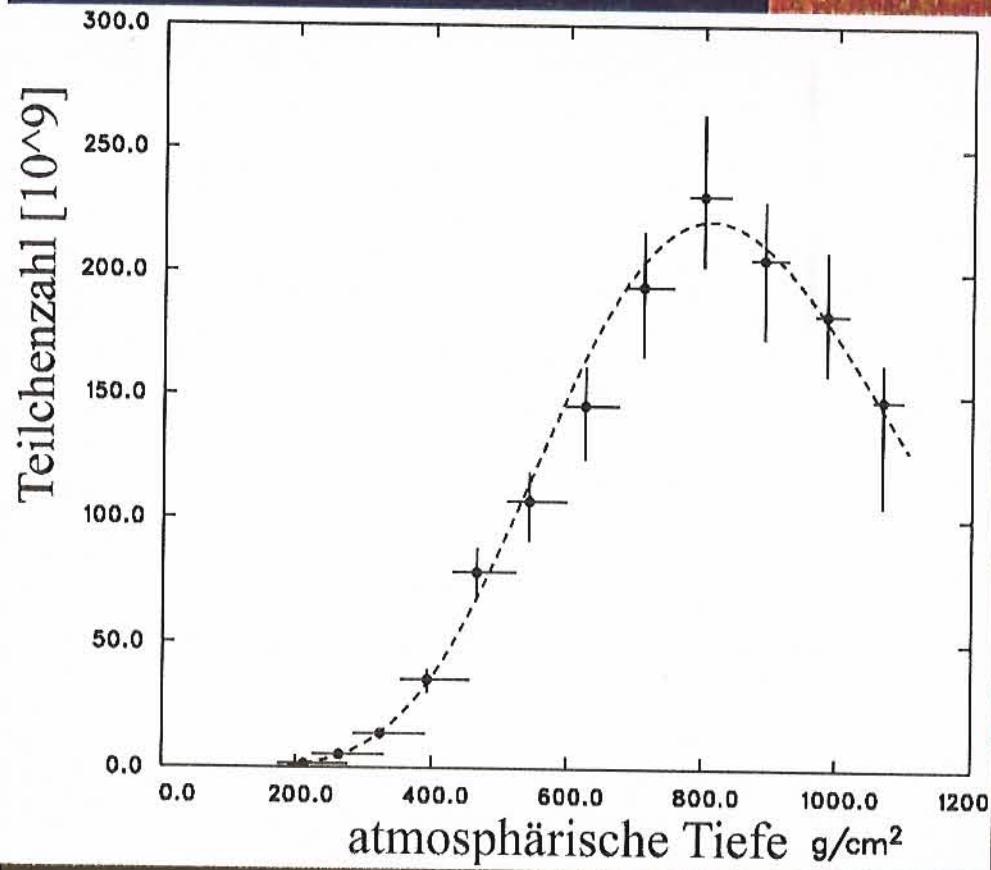

p, 1 PeV, vertical, QGS-NKG

Fly's Eye

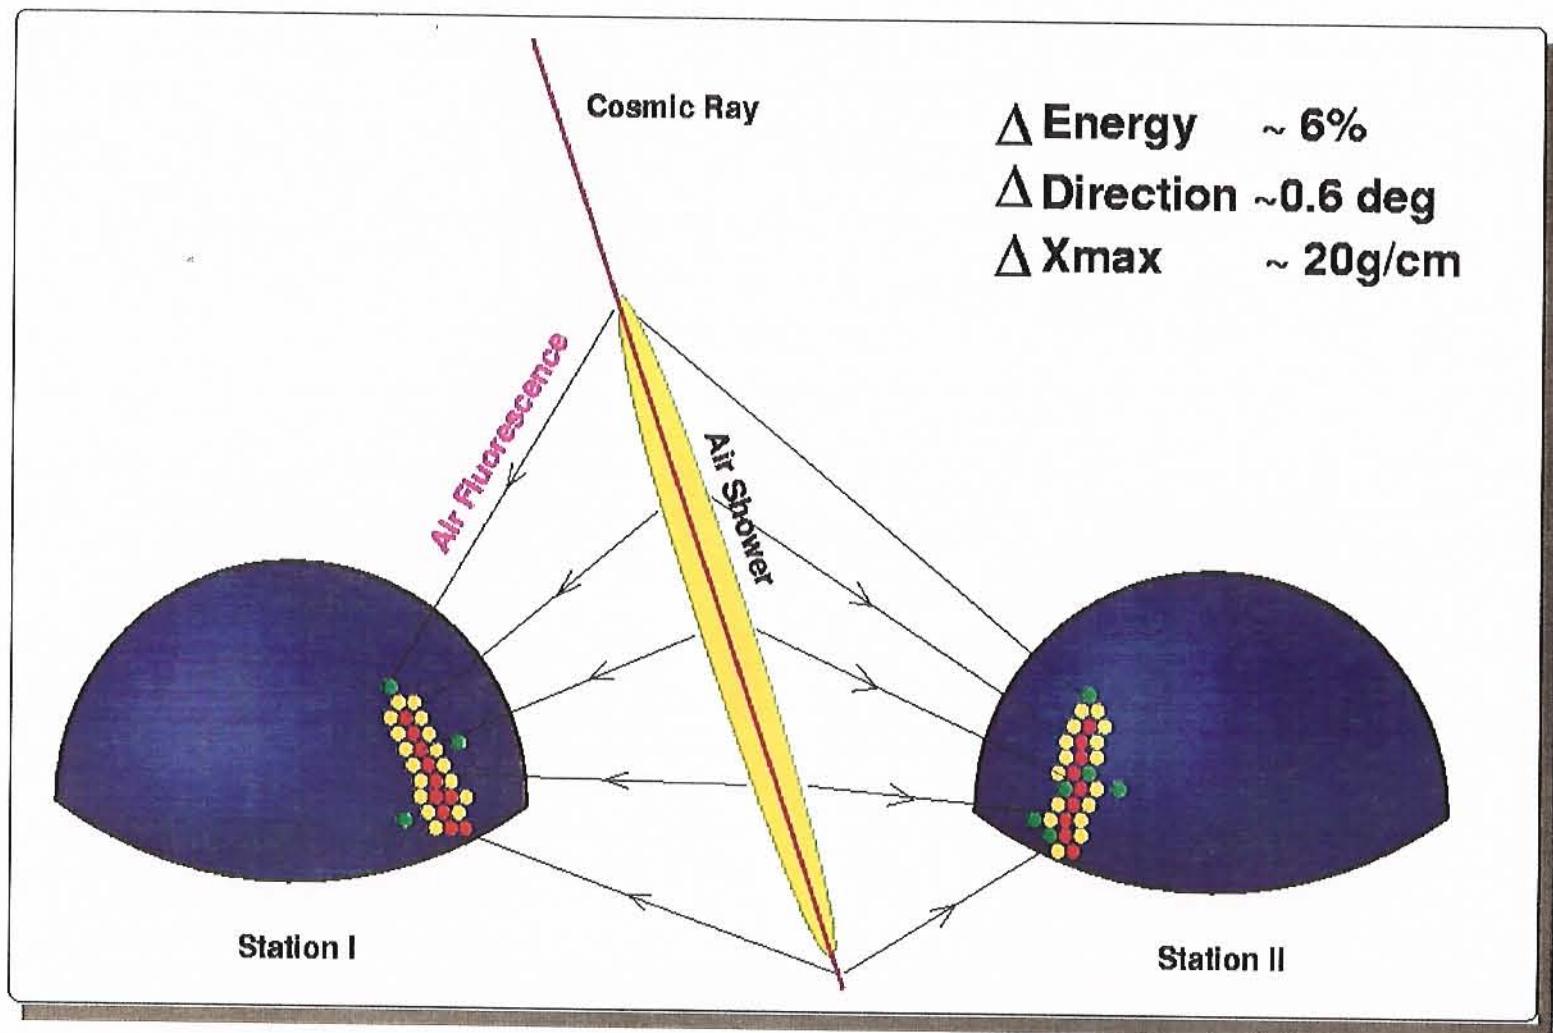

more details...

one event had 3.2×10^{20} eV
50 Joules in a single particle !

stereo reconstruction

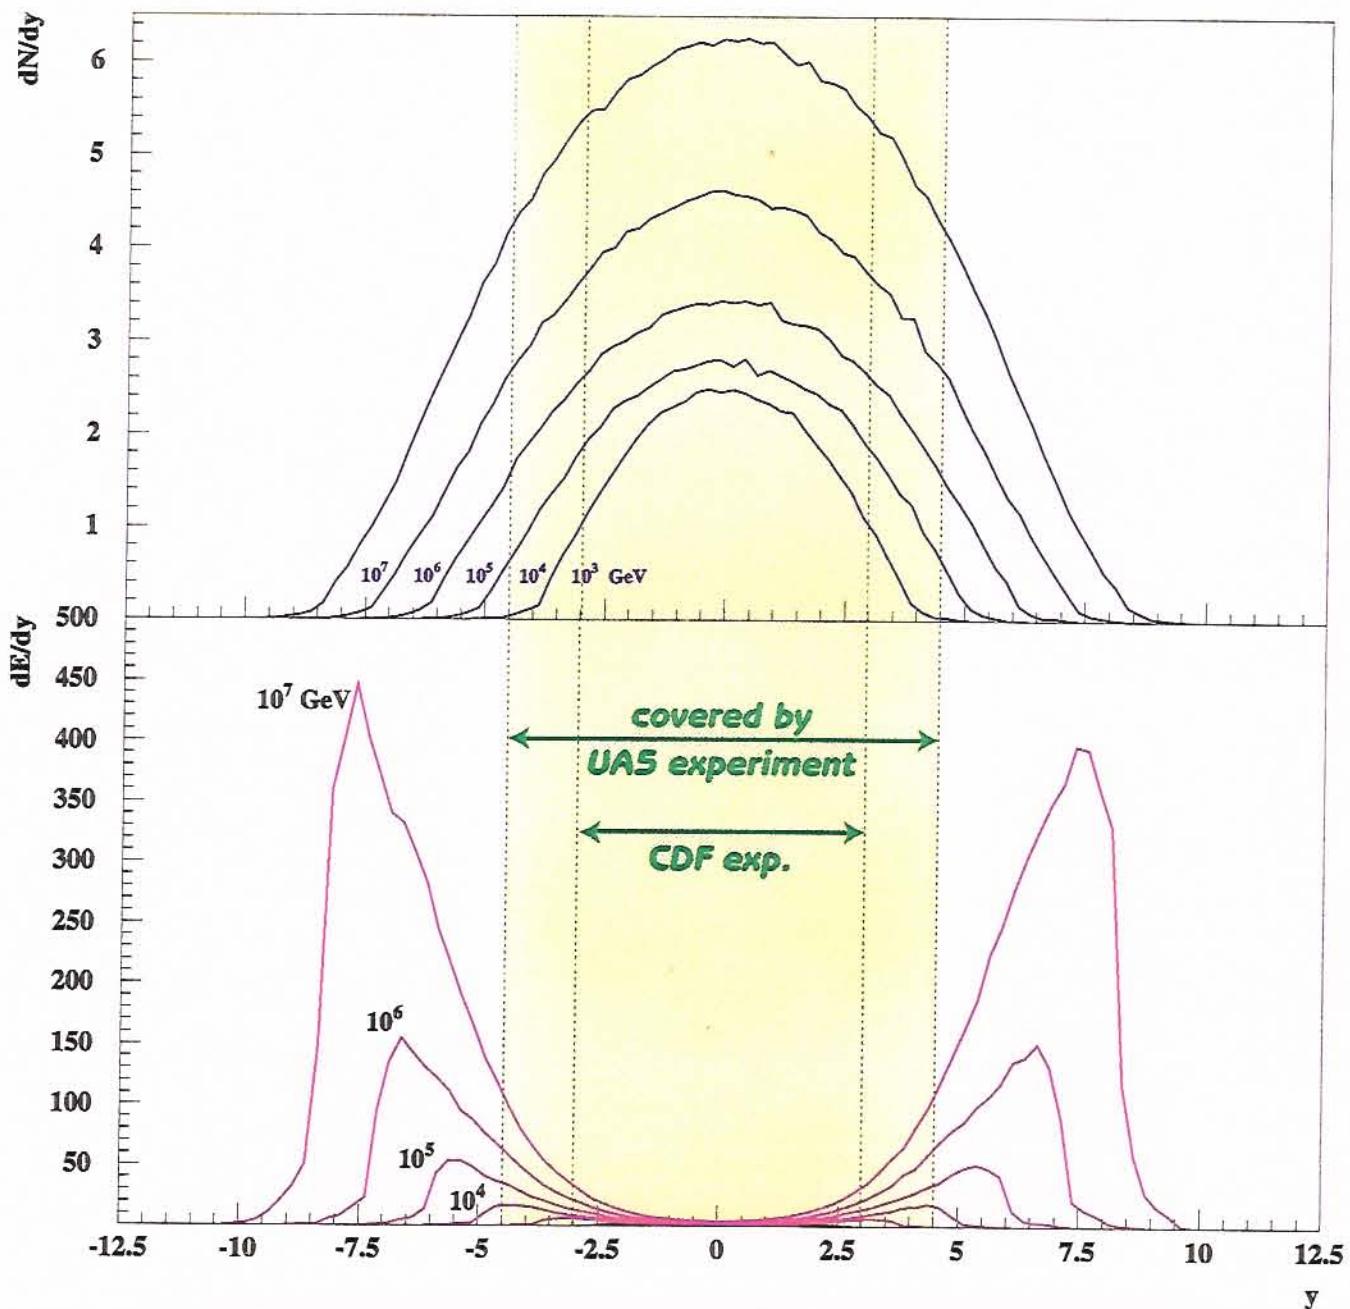

excellent angular resolution & energy determination

INPUT REQUIRED FOR EAS SIMULATIONS

- Particle decay properties
well known
- e.m. cross sections
well known
- cross sections of hadron nucleus
interactions
not (well) known

Particle and Energy Flow in $p\bar{p}$ -Interactions

**Most energy in collider experiments
remains unseen...!!**
