Finkbeiner et al. (1999)

template fitting

$$S_{23} \times \text{[Image 1]} + f_{23} \times \text{[Image 2]} + d_{23} \times \text{[Image 3]} = \text{[Image 4]} - C_{23} \times \text{[Image 5]}$$

The diagram illustrates the template fitting process for a 23 GHz image. It shows the decomposition of a target image into a sum of three template images (labeled S_{23} , f_{23} , and d_{23}) and a residual image (labeled C_{23}). The target image is labeled "23 GHz".

template fitting

$$s_{23} \times \text{[Image 1]} + f_{23} \times \text{[Image 2]} + d_{23} \times \text{[Image 3]} = \text{[Image 4]} - c_{23} \times \text{[Image 5]}$$

The equation illustrates the template fitting process for a 23 GHz radio image. The left side shows the sum of three template images: s_{23} (synchrotron), f_{23} (free-free), and d_{23} (dust). The right side shows the resulting 23 GHz image (labeled "23 GHz") minus a noise template c_{23} .

$s(\nu_i)$, $f(\nu_i)$, $d(\nu_i)$ represent estimates of the synchrotron, free-free, and dust spectra

determining foreground spectra

Multi-Linear Regression

Template Fit

- Bands are completely decoupled
- Spectral shapes are unconstrained
- Constant across the sky

$$P\vec{a} = w$$

$$\vec{a} = (P / \sigma)^+ (w / \sigma)$$

$$\left\| \frac{P}{\sigma} \vec{a} - \frac{w}{\sigma} \right\|^2 = \frac{\|P\vec{a} - w\|^2}{\sigma^2} \equiv \chi^2$$

Dobler & Finkbeiner, 2008

TEMPLATES

- Synchrotron: Haslam et al (1982)
- Dust: FDS99 (*Finkbeiner et al 1999*)
- Free-free: H α Map (WHAM, SHASSA, VTSS; assembled and corrected for dust by Finkbeiner 2003)

CMB ESTIMATORS

- 6 different types
- introduces a cross-correlation bias
- mean zero
- largest source of uncertainty

determining foreground spectra

Multi-Linear Regression

Template Fit

- Bands are completely decoupled
- Spectral shapes are unconstrained
- Constant across the sky

$$P\vec{a} = w$$

$$\vec{a} = (P / \sigma)^+ (w / \sigma)$$

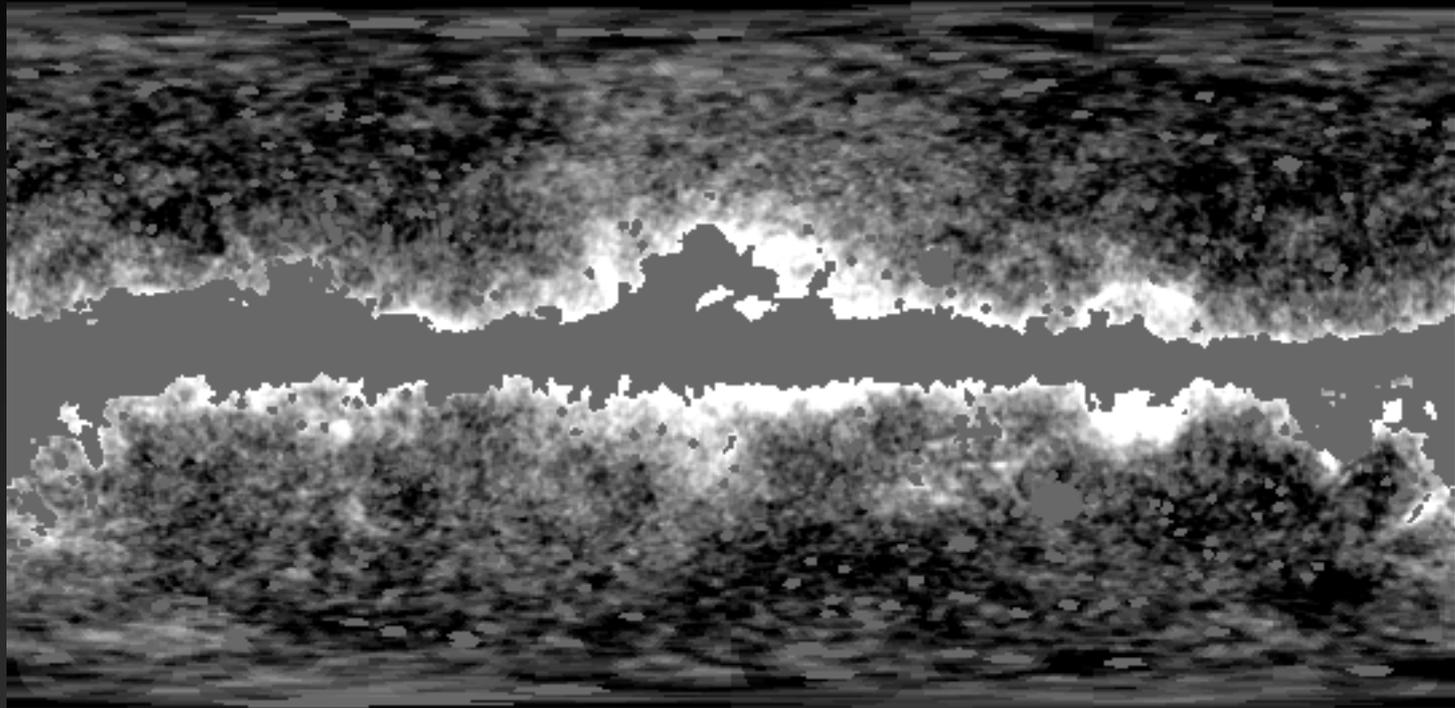

$$\left\| \frac{P}{\sigma} \vec{a} - \frac{w}{\sigma} \right\|^2 = \frac{\|P\vec{a} - w\|^2}{\sigma^2} \equiv \chi^2$$

Dobler & Finkbeiner, 2008

peeling away foregrounds

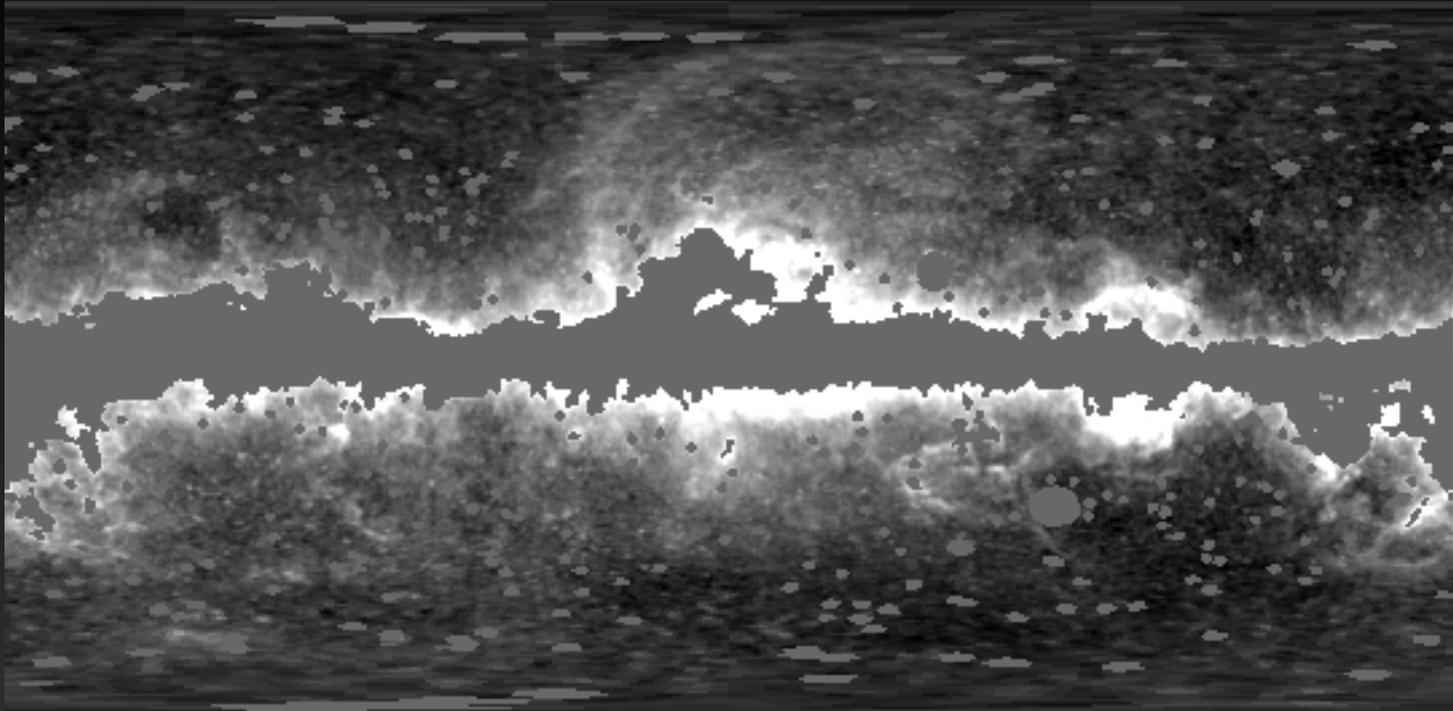

K-band: 23 GHz

WMAP - CMB - free-free
- (thermal and spinning) dust
- (soft) synchrotron

the haze spectrum

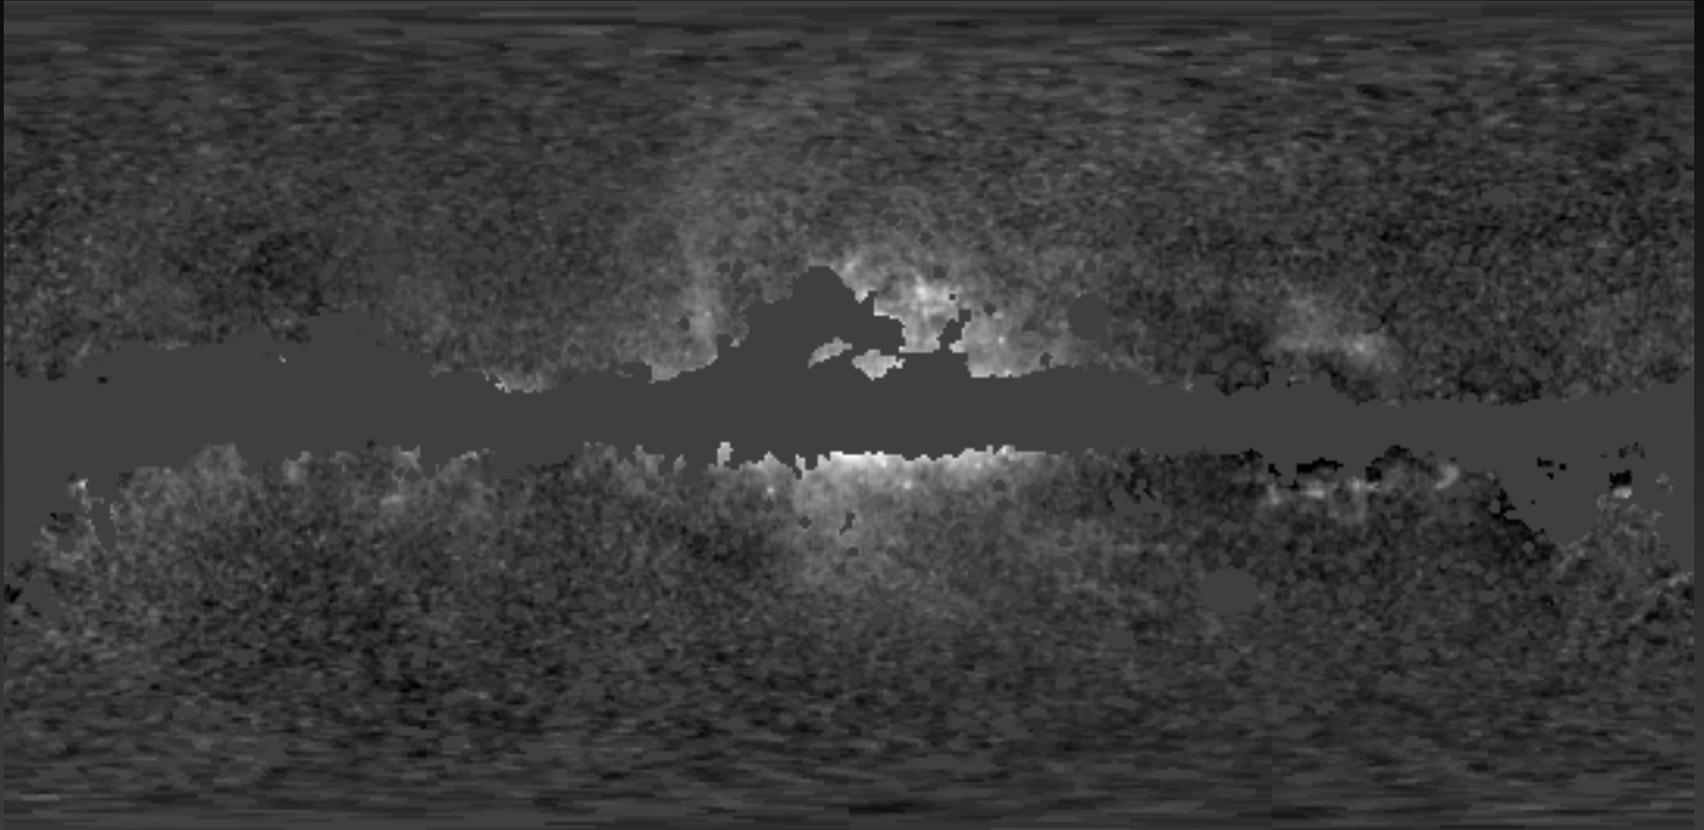

K-band: 23 GHz

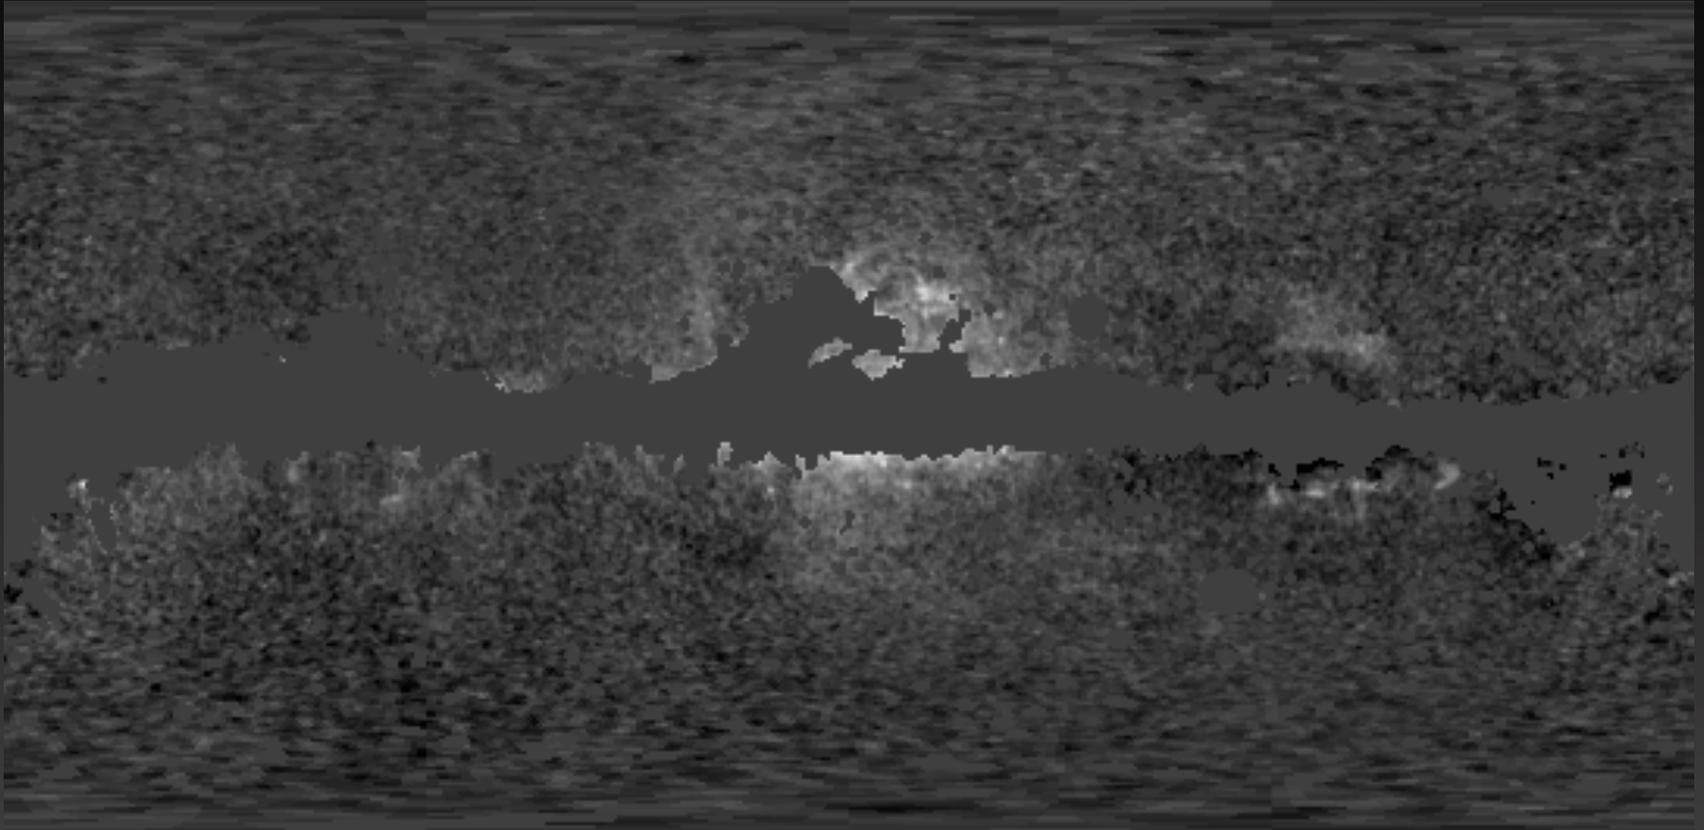

WMAP - CMB - free-free
- (thermal and spinning) dust

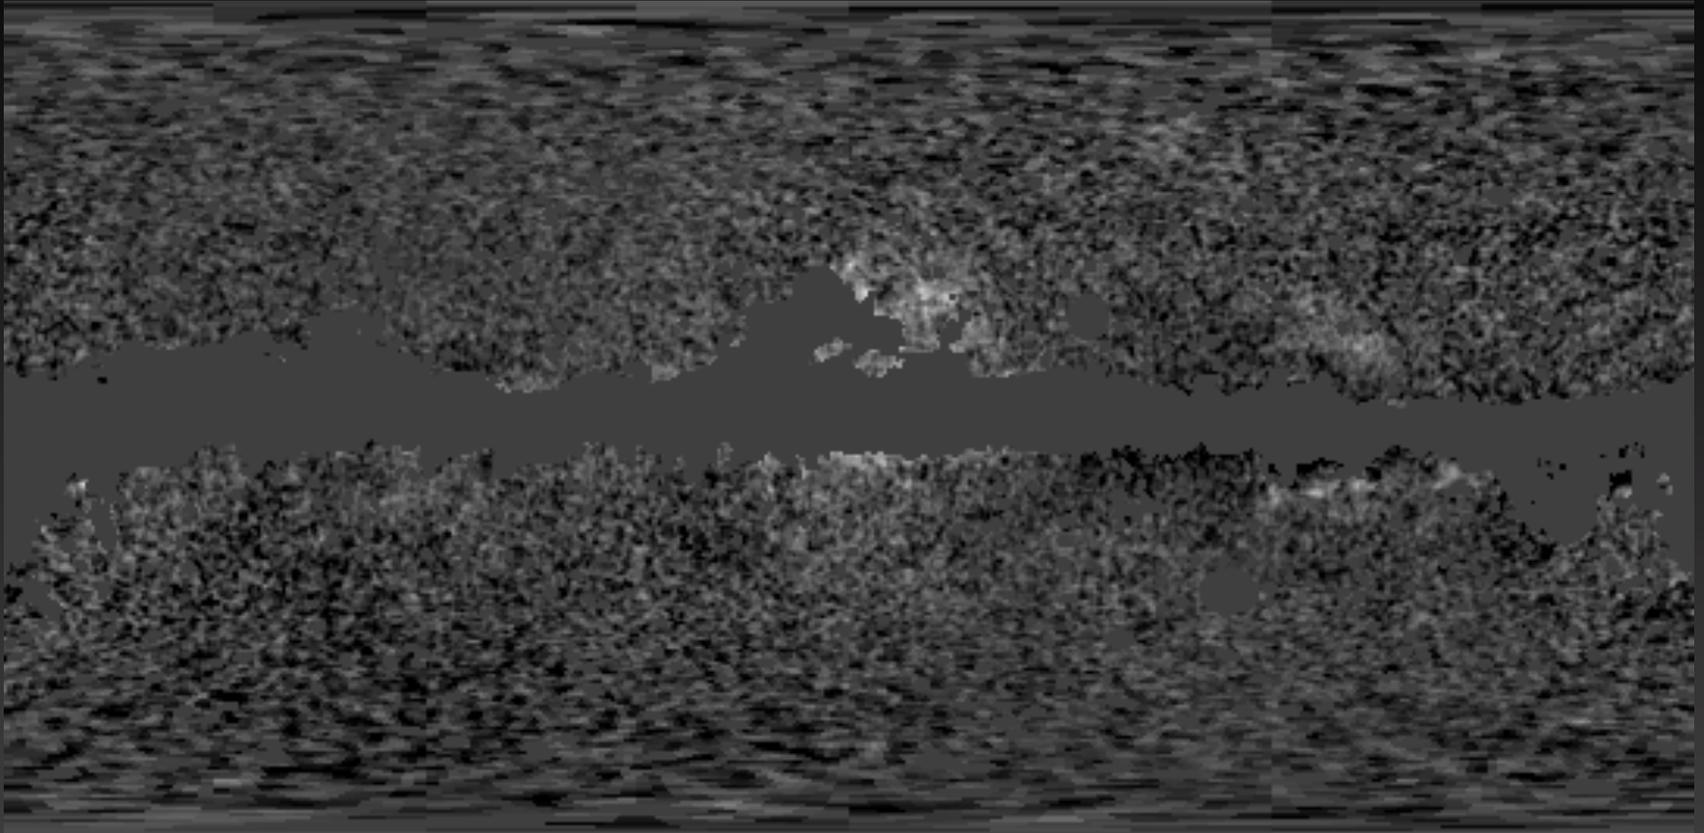

23 GHz Synchrotron

33 GHz Synchrotron

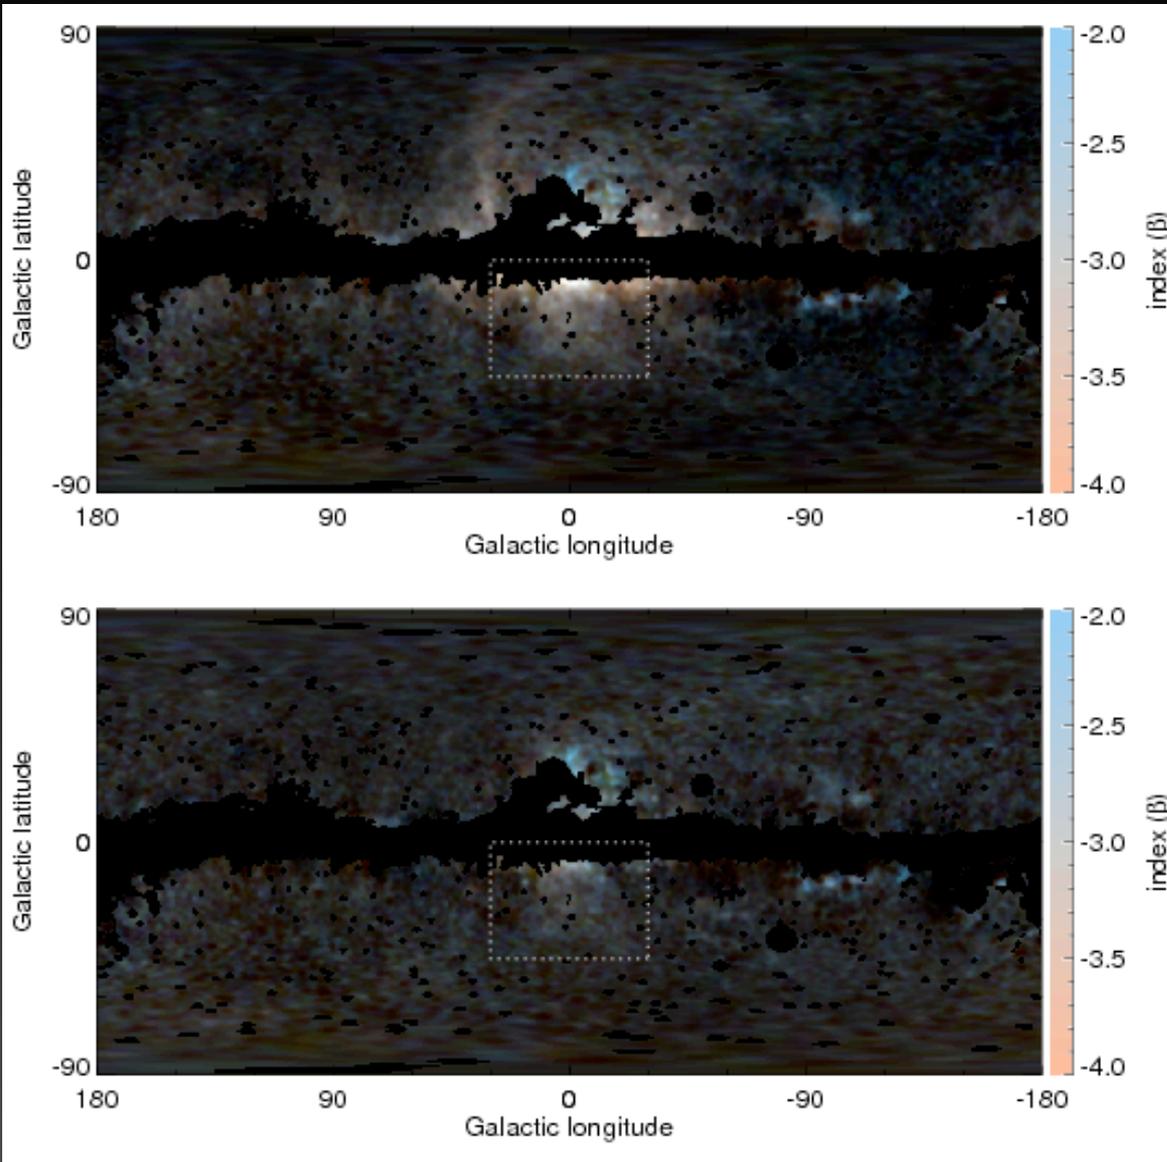

41 GHz Synchrotron

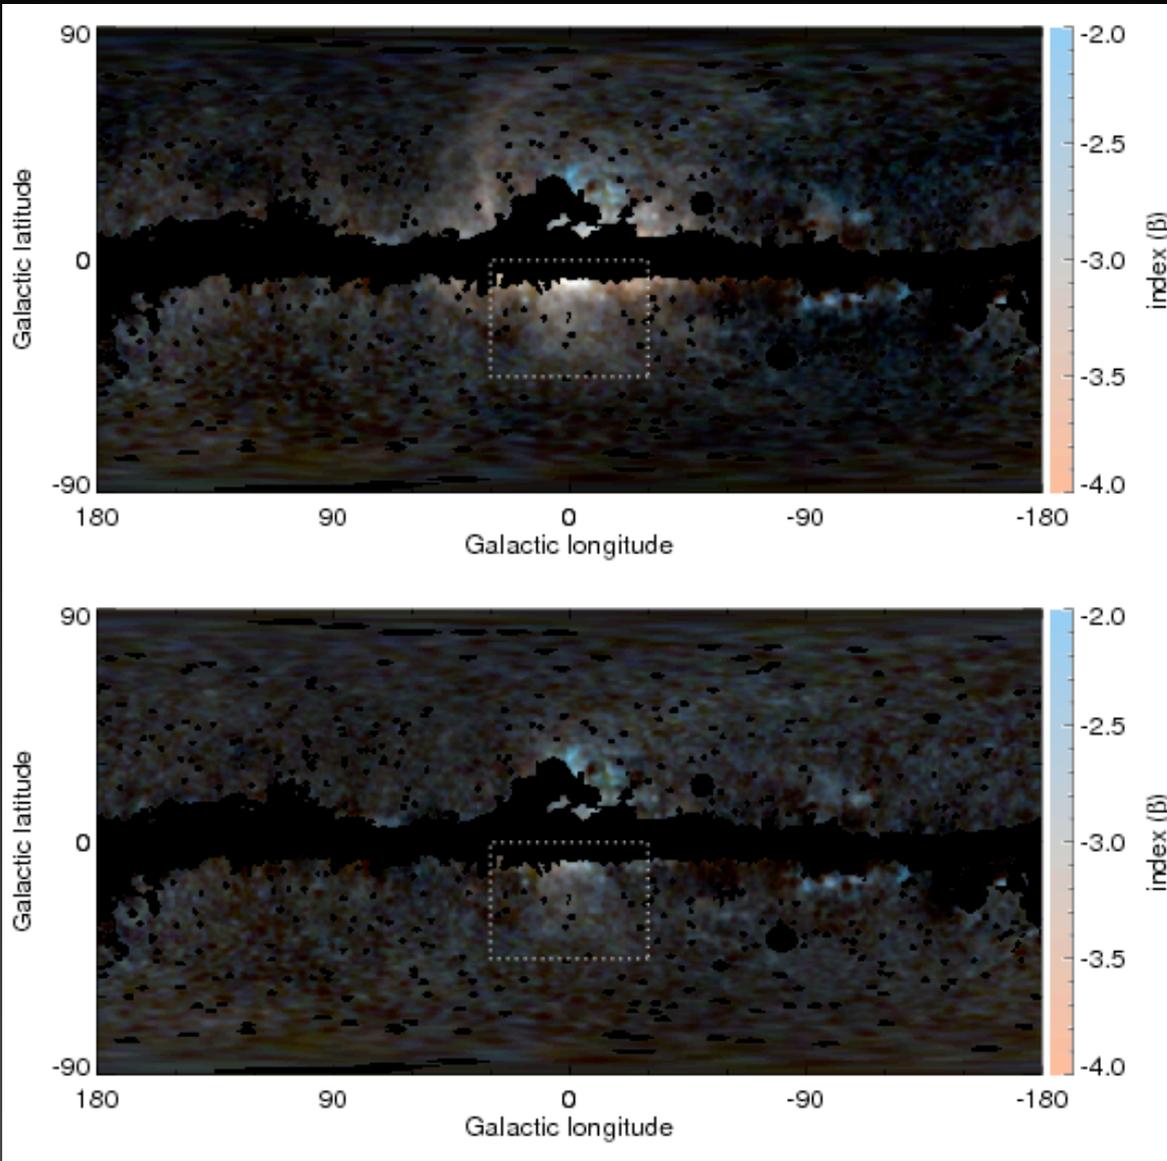

61 GHz Synchrotron

the haze spectrum

- Looks like synchrotron with,
 $E^2 dN/dE \propto E^\alpha$ $-0.1 \leq \alpha \leq 0.2$
- If it is synchrotron, it requires
 - hard e^+e^- spectrum
 - extended emission
- Very difficult to produce astrophysically

the haze spectrum

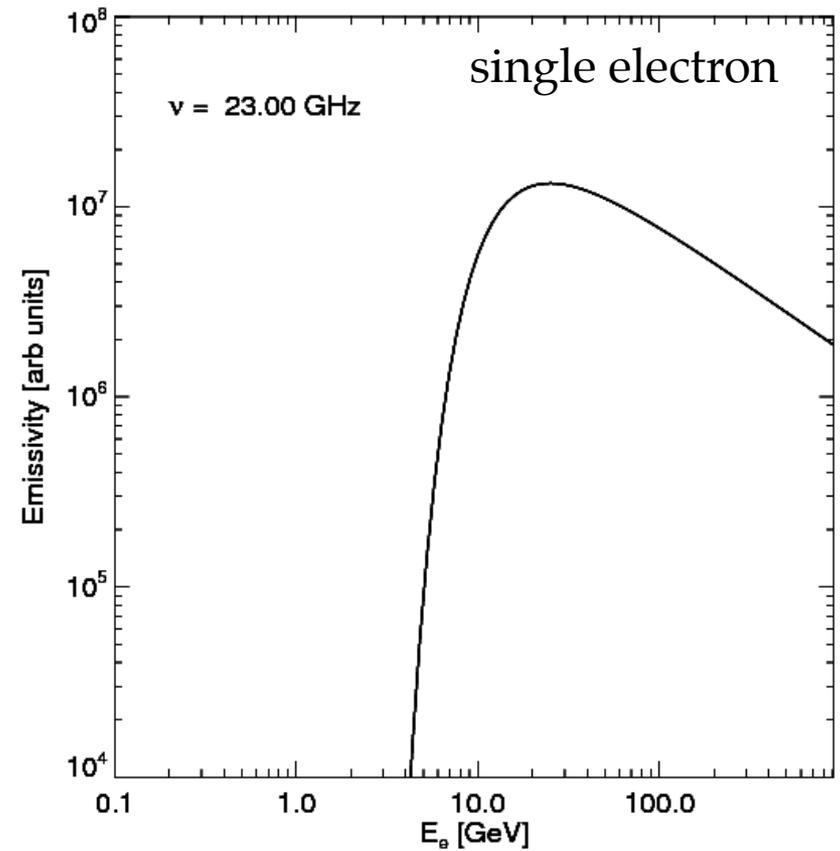

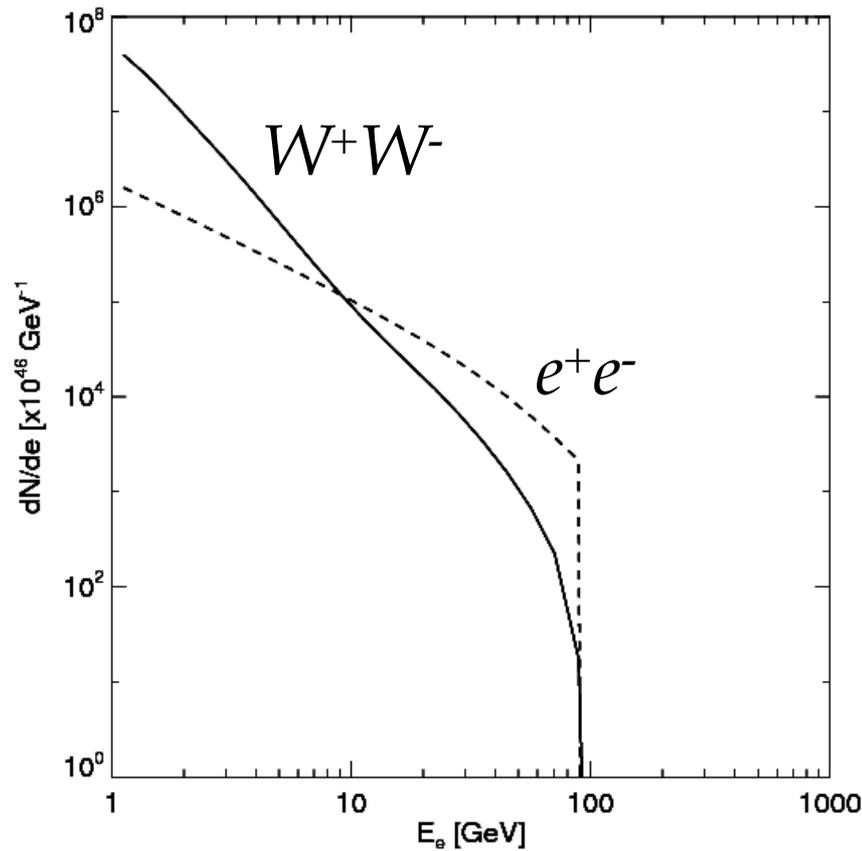

implication:

the (diffuse)
cosmic-ray e^+e^-
spectrum is **harder**
at **$\sim 10-100$ GeV**
towards the GC than
elsewhere in the
Galaxy

Dobler & Finkbeiner (2008)

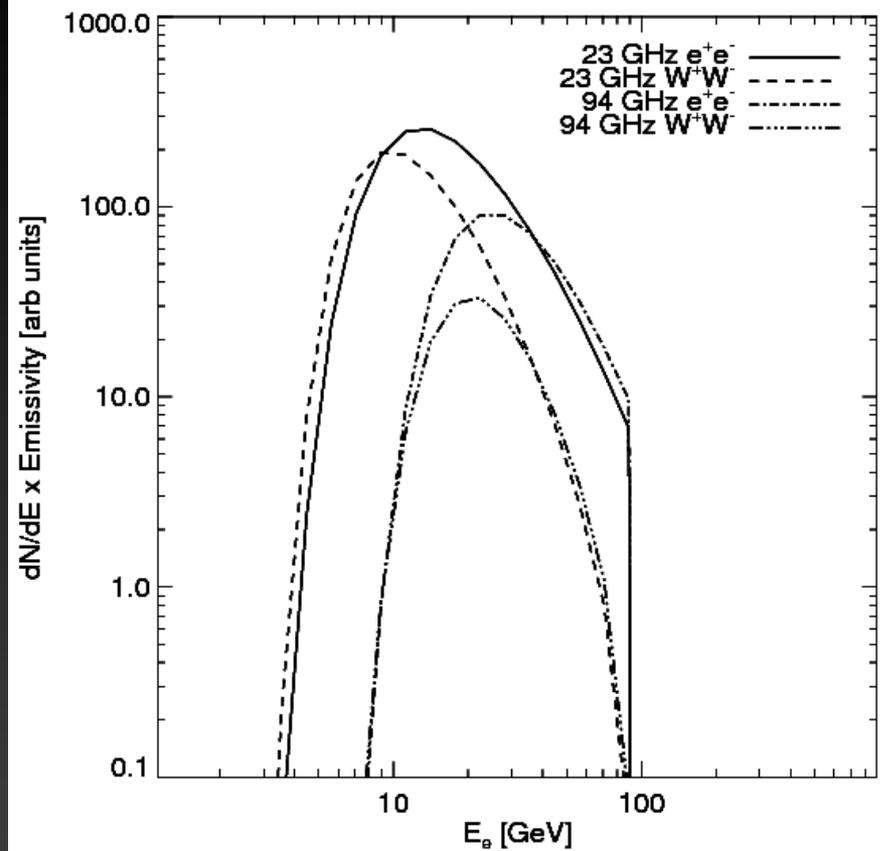

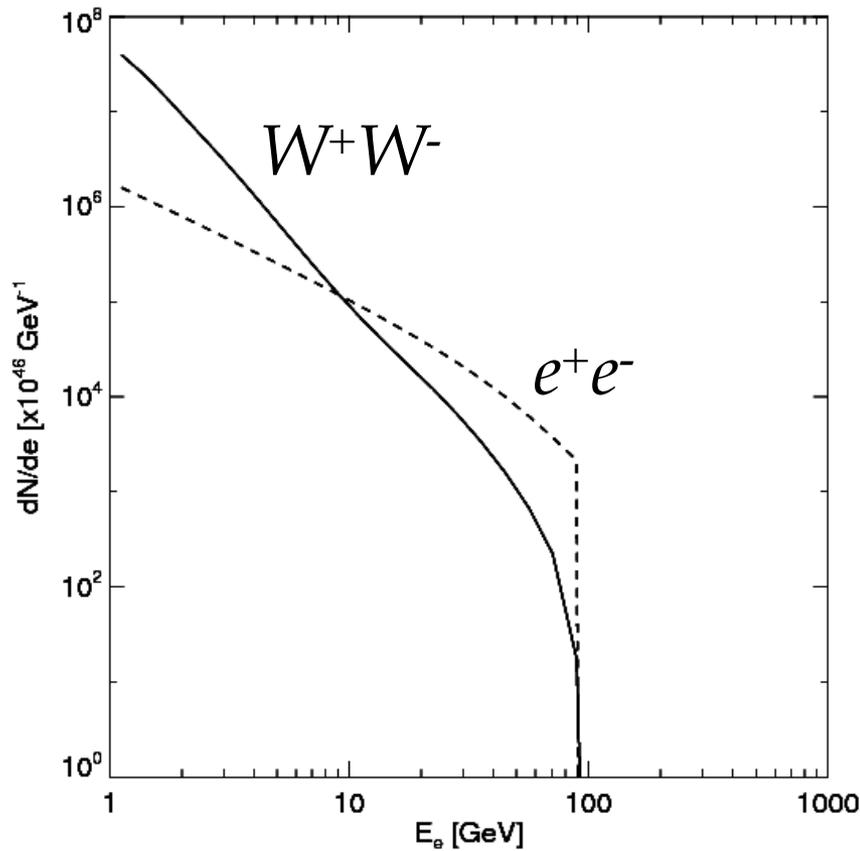

dark matter and the haze

spherical shell:
 $r = 8.4$ kpc, $dr = 0.1$ kpc

~ 10 - 100 GeV electrons are
dominant contribution to 23 GHz
synchrotron emission

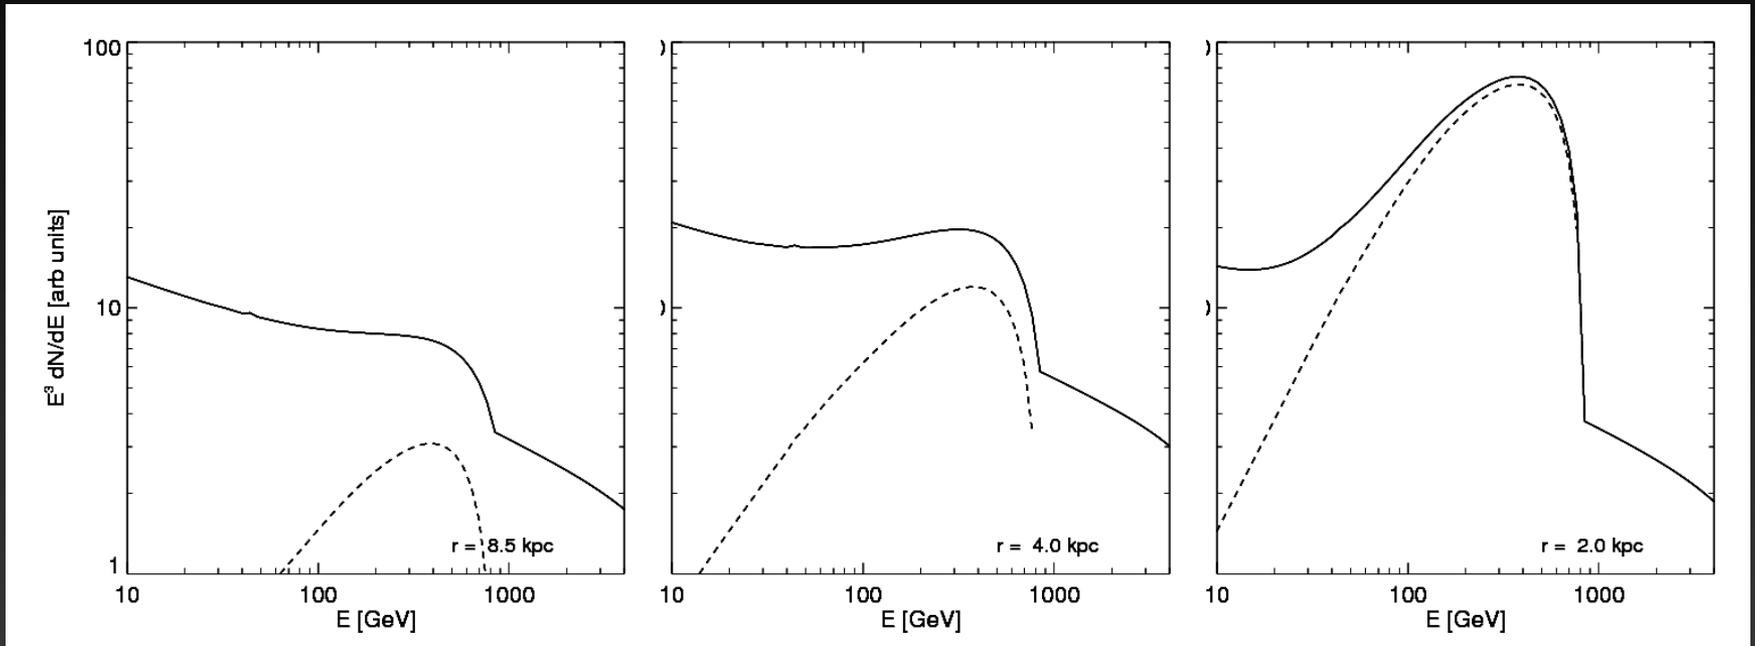

dark matter and the haze

spherical shell:
 $r = 8.4$ kpc, $dr = 0.1$ kpc

e^+e^- channel yields ~ 10 x more emission at 23 GHz compared to W^+W^-

dark matter and the haze

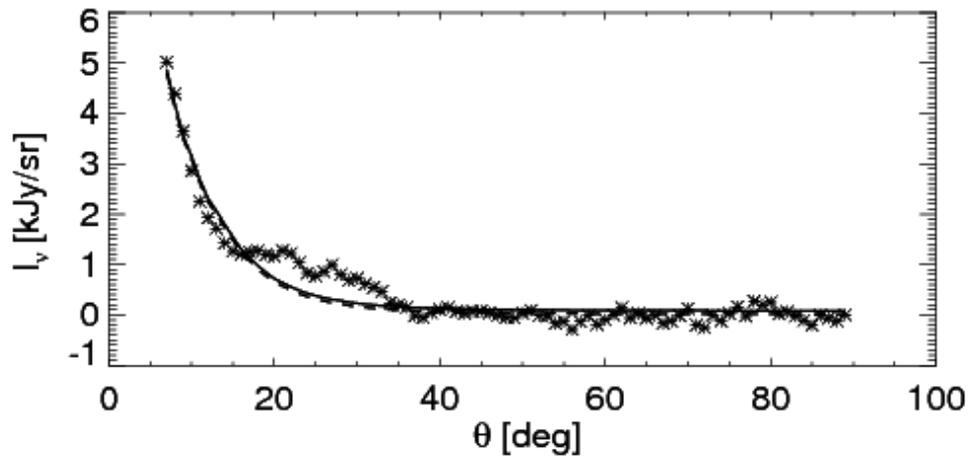

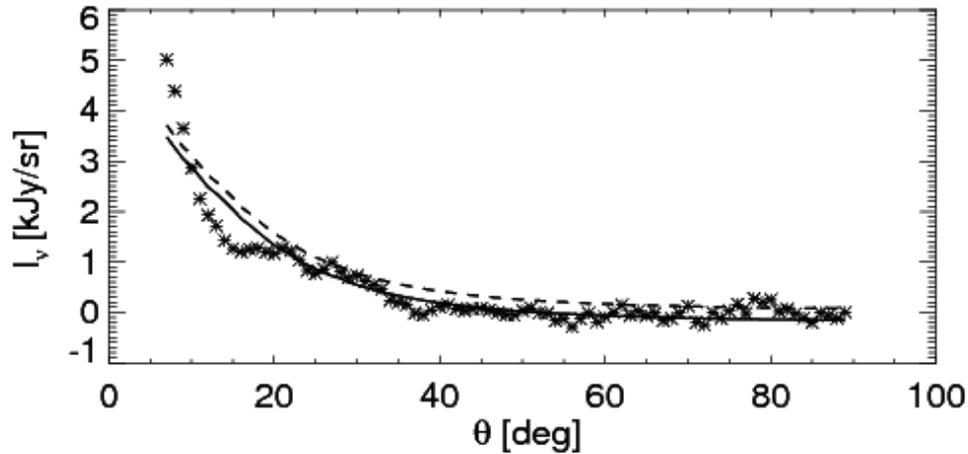

$r = 8.5$ kpc

$r = 4.0$ kpc

$r = 2.0$ kpc

dark matter and the haze

Galactic/baryon params:

$$B \sim 10 \mu\text{G}$$

$$K(E) \sim 10^{28} \text{ cm}^2/\text{s}$$

Dark matter params:

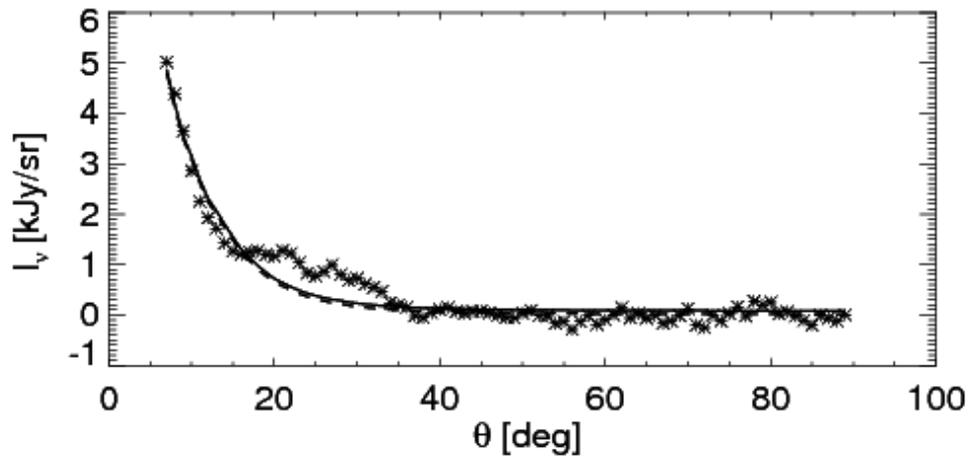

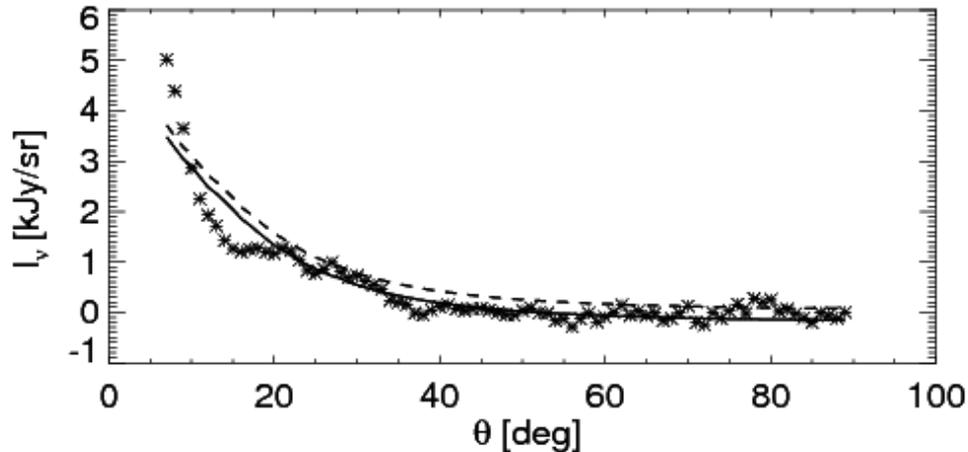

$$\rho = \rho(r)$$

$$M \sim 100 \text{ GeV}$$

$$\langle \sigma v \rangle_{e^+e^-} \sim 10^{-26} \text{ cm}^3/\text{s}$$

$$\langle \sigma v \rangle_{W^+W^-} \sim 10^{-25} \text{ cm}^3/\text{s}$$

dark matter and the haze

Galactic/baryon params:

$$B \sim 10 \mu\text{G}$$

$$K(E) \sim 10^{28} \text{ cm}^2/\text{s}$$

Dark matter params:

$$\rho = \rho(r)$$

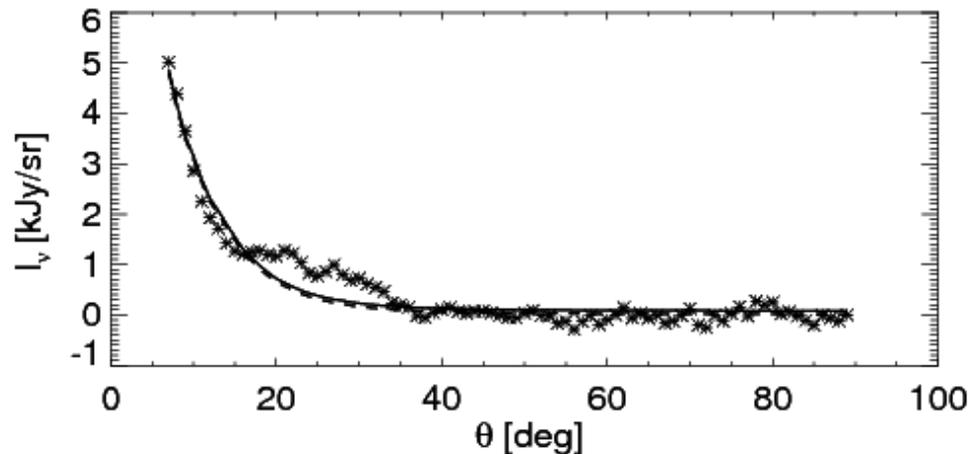

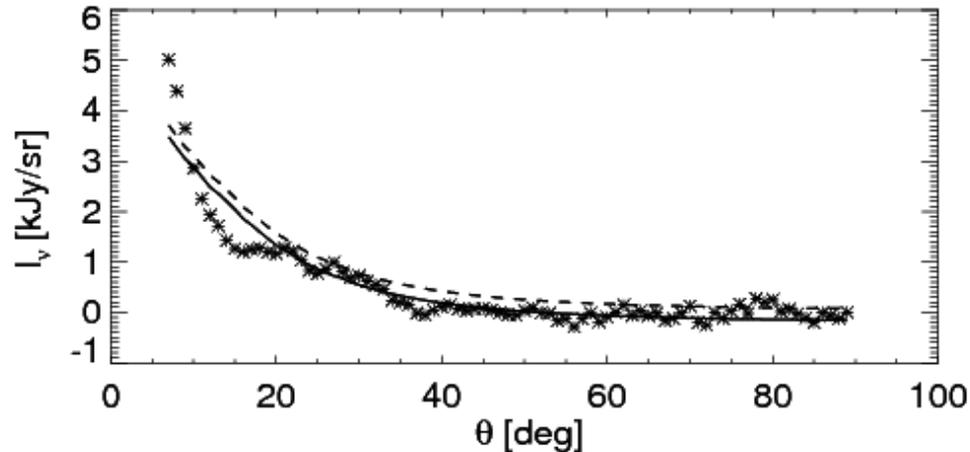

$$M \sim 100 \text{ GeV}$$

$$\langle\sigma v\rangle_{e^+e^-} \sim 10^{-26} \text{ cm}^3/\text{s}$$

$$\langle\sigma v\rangle_{W^+W^-} \sim 10^{-25} \text{ cm}^3/\text{s}$$

the haze is
consistent with a
WIMP annihilation
scenario

dark matter and the haze

Galactic/baryon params:

$$B \sim 10 \mu\text{G}$$

$$K(E) \sim 10^{28} \text{ cm}^2/\text{s}$$

Dark matter params:

$$\rho = \rho(r)$$

$$M \sim 100 \text{ GeV}$$

$$\langle\sigma v\rangle_{e^+e^-} \sim 10^{-26} \text{ cm}^3/\text{s}$$

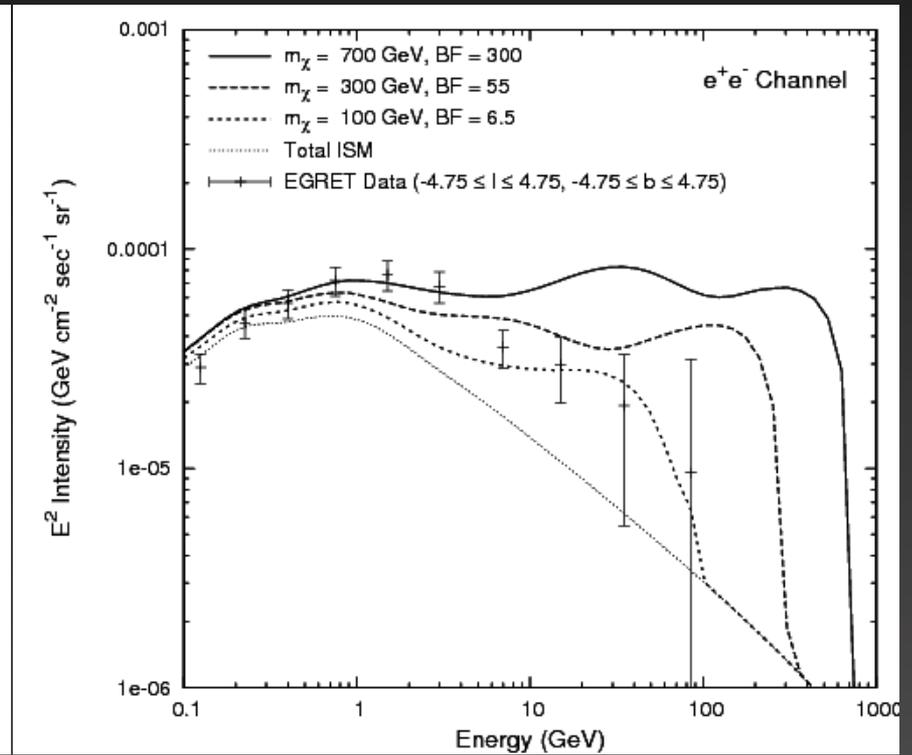

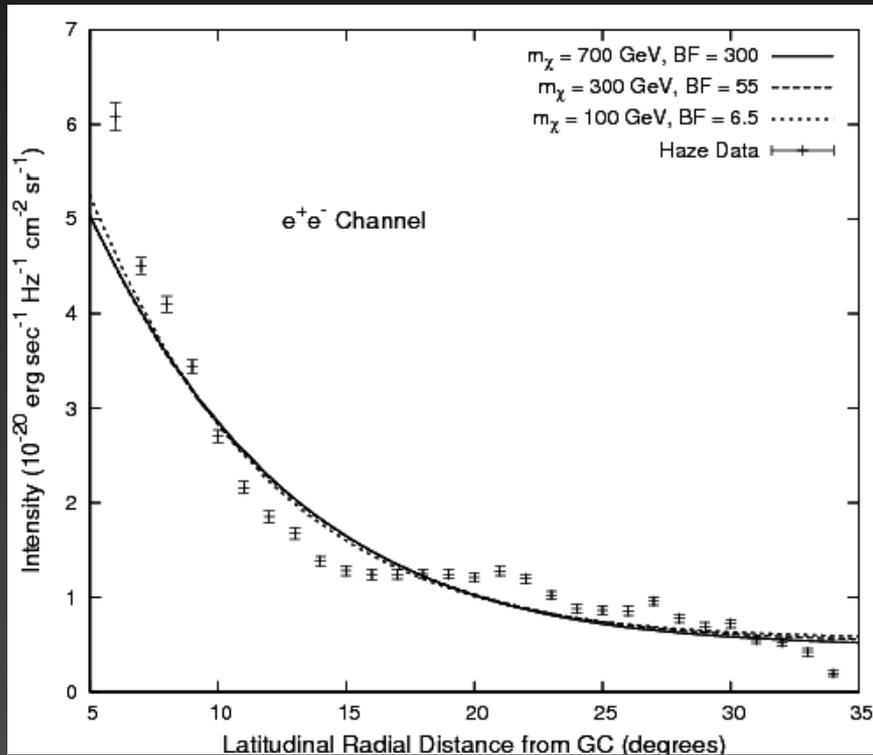

$$\langle\sigma v\rangle_{W^+W^-} \sim 10^{-25} \text{ cm}^3/\text{s}$$

the haze is
consistent with a
WIMP annihilation
scenario

there are large astrophysical uncertainties!

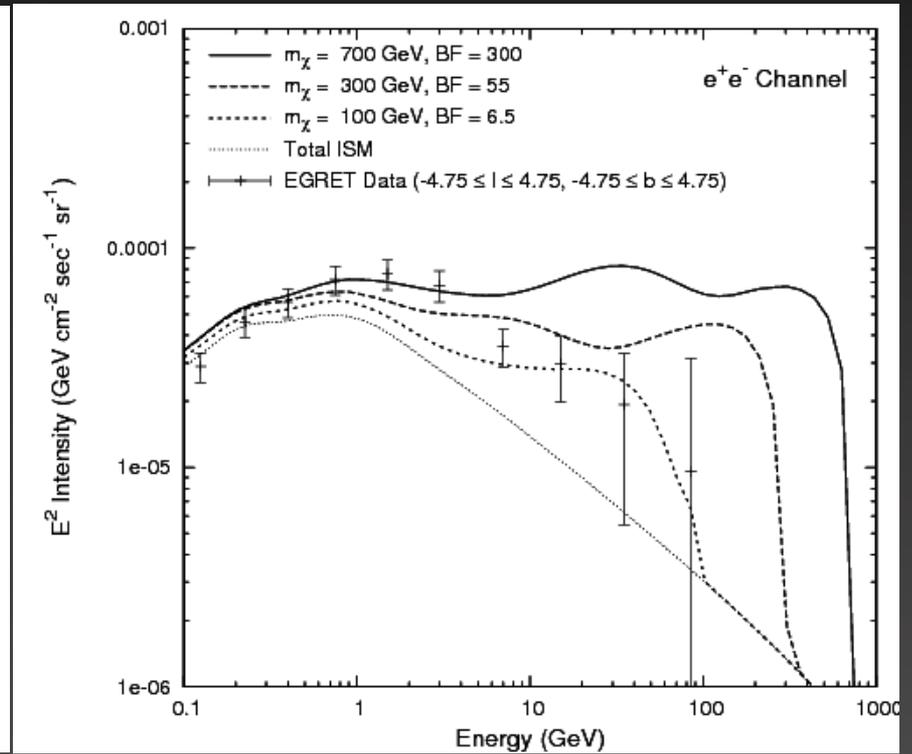

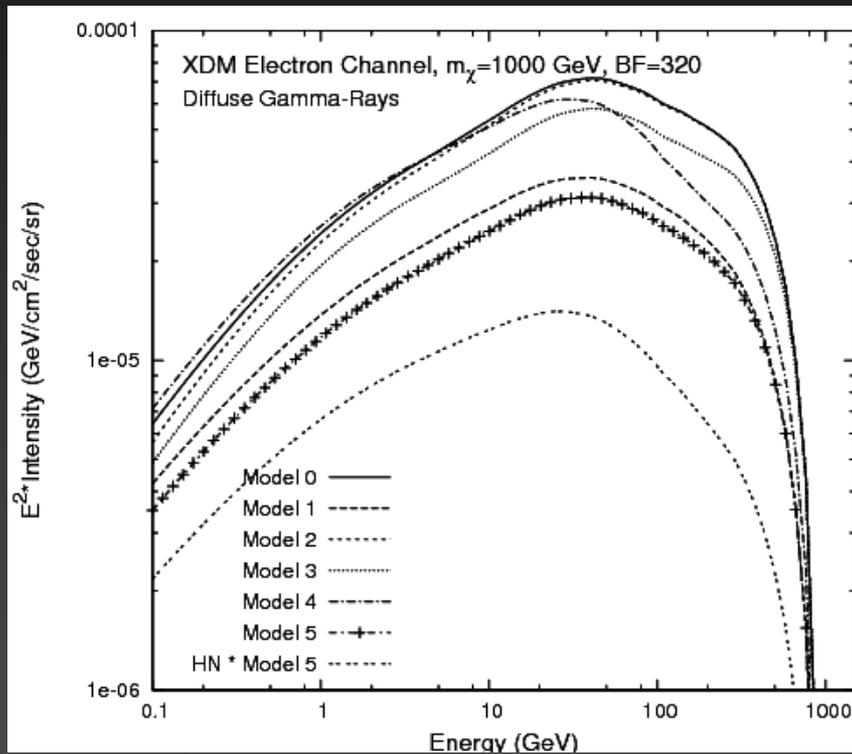

dark matter and the haze

the existence of the haze (regardless of its origin)
implies an inverse Compton signal within a few
degrees of the GC

dark matter and the haze

the existence of the haze (regardless of its origin)
implies an inverse Compton signal within a few
degrees of the GC

the haze...

facts and myths

the haze...

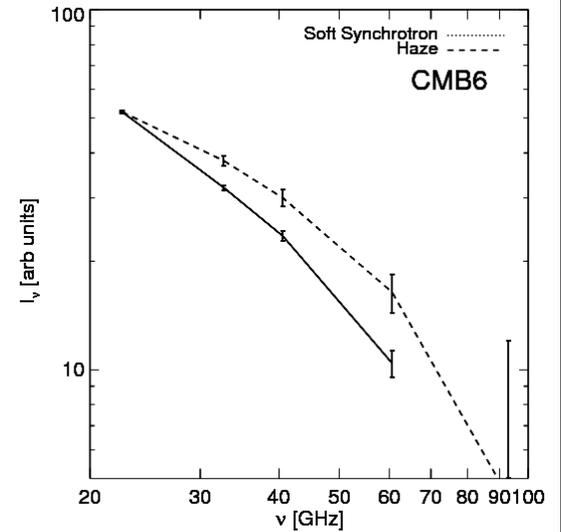

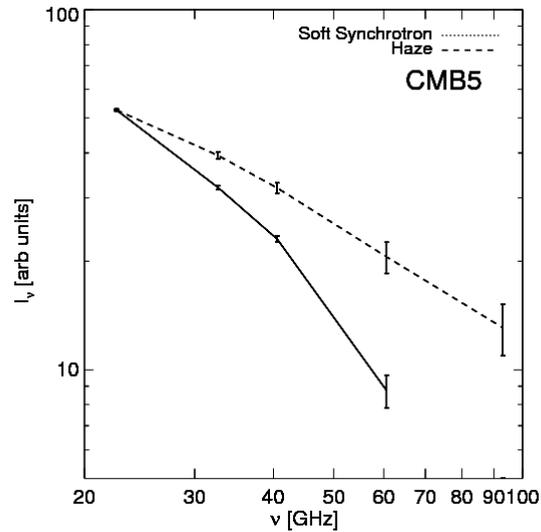

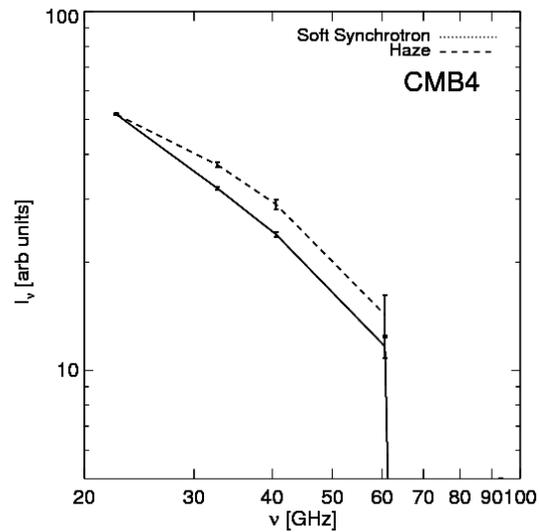

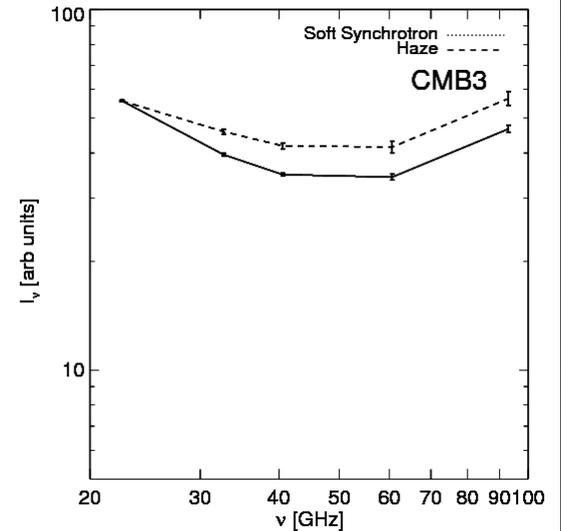

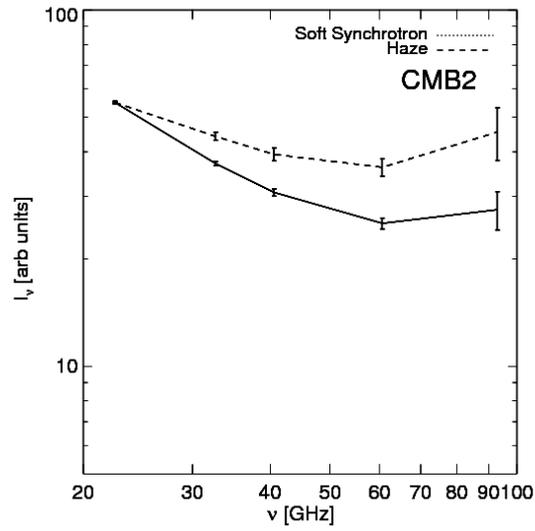

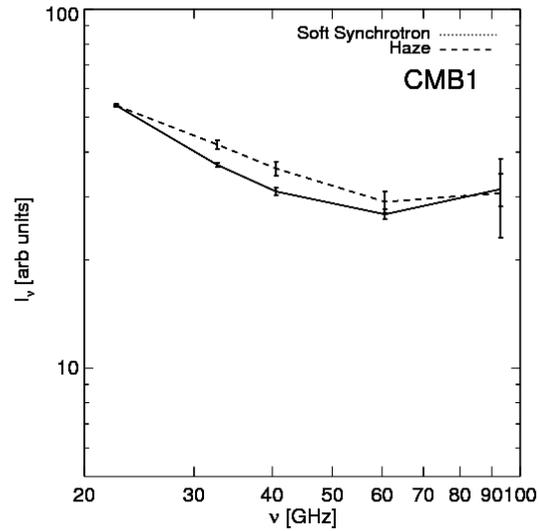

facts and ~~myths~~

misconceptions

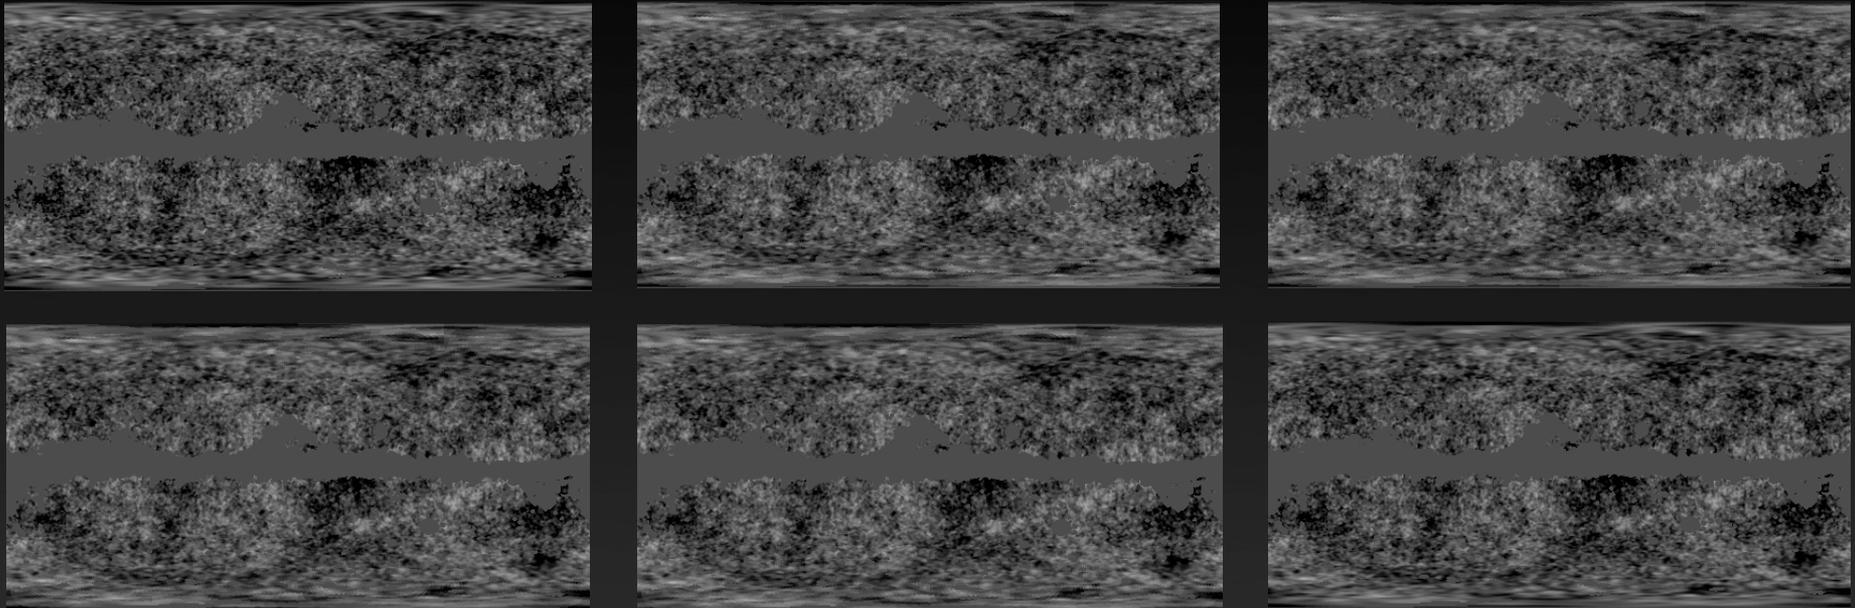

the haze: facts

- foreground spectra have significant uncertainties
 - CMB cross-correlations (systematic)
 - template approximations

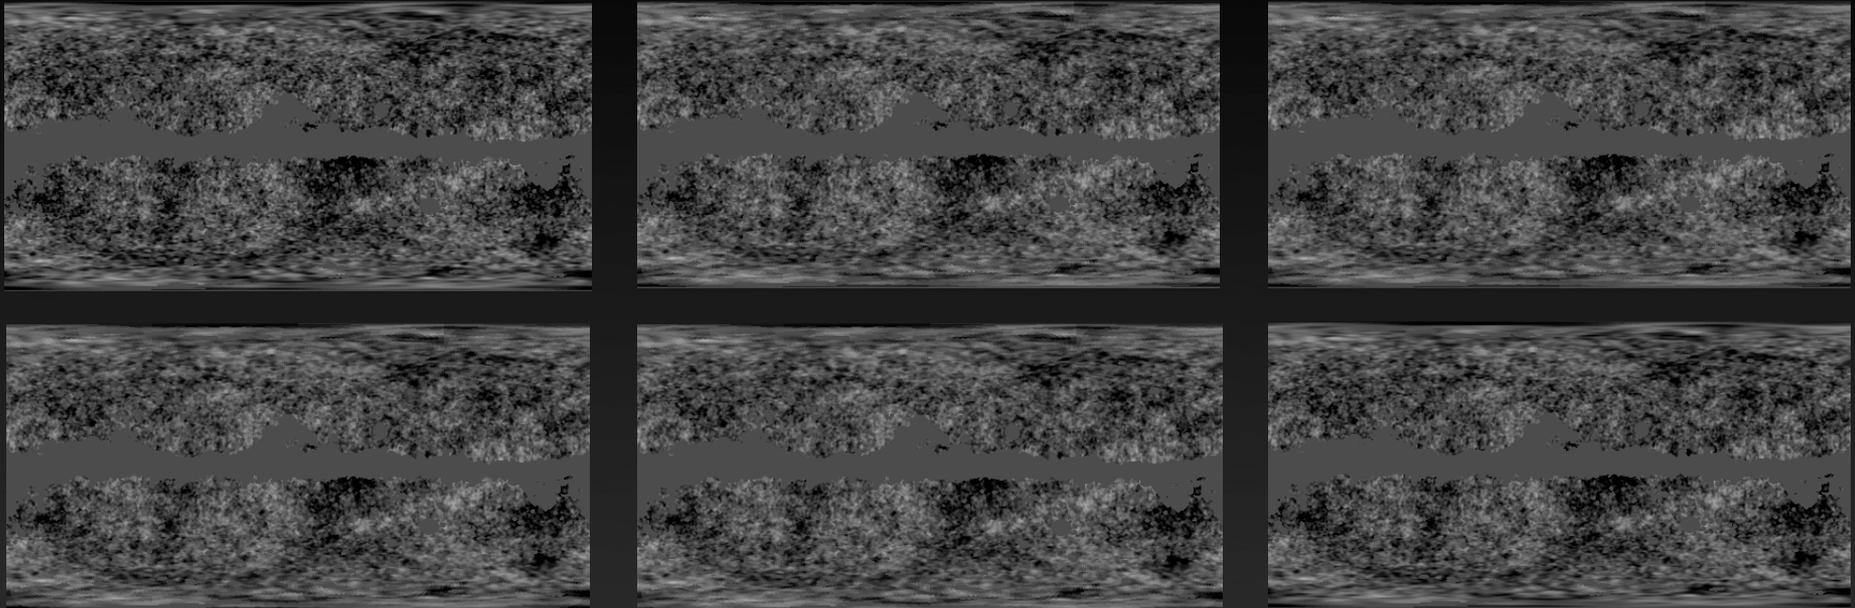

the haze: facts

CMB “cross-correlation” bias

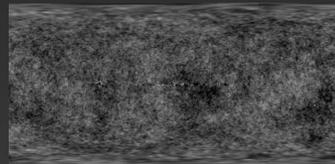

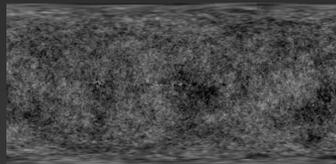

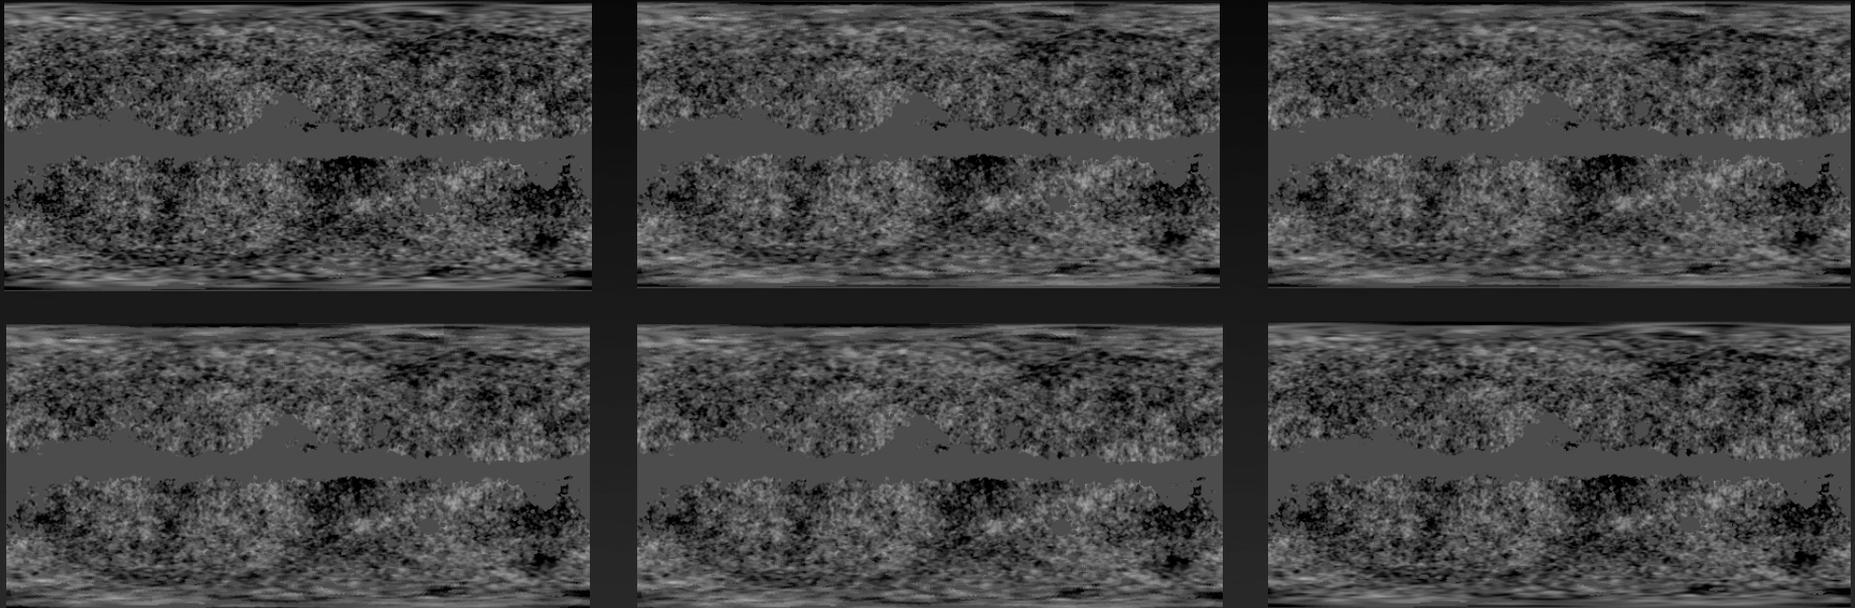

CMB "cross-correlation" bias

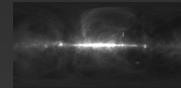

$$S_{23} \times \text{[CMB Map]} + f_{23} \times \text{[Galaxy Map]} + d_{23} \times \text{[Galaxy Map]} = \text{[23 GHz Map]} - C_{23} \times \text{[CMB Map]}$$

The diagram illustrates the decomposition of the cross-correlation signal. On the left, the cross-correlation signal S_{23} is shown as a CMB map. This is equal to the 23 GHz map (labeled "23 GHz") minus the cross-correlation bias C_{23} , which is shown as a CMB map. The right side of the equation shows the components of the cross-correlation signal: f_{23} (Galaxy bias) and d_{23} (dust bias), both multiplied by a Galaxy map.

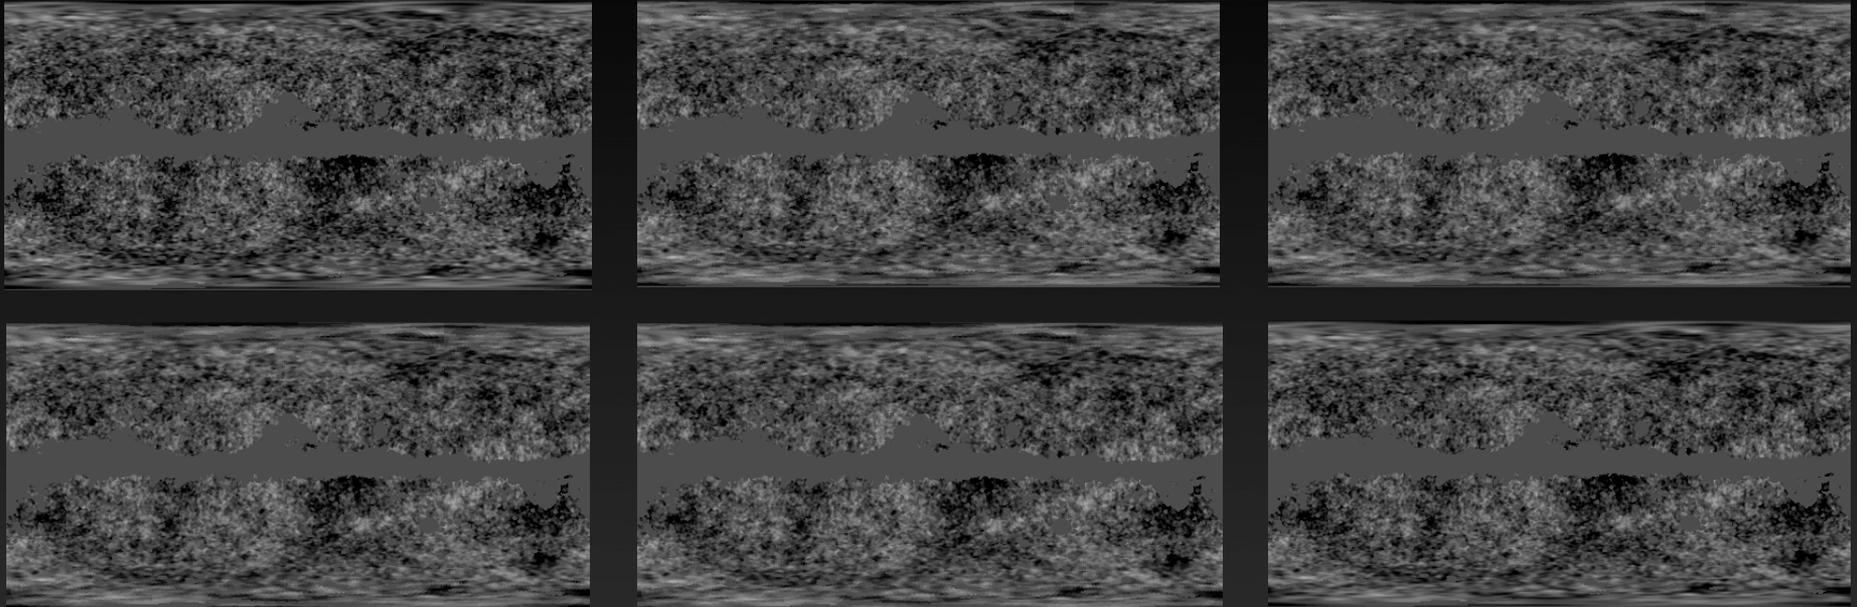

CMB “cross-correlation” bias

+ $b_s \times$

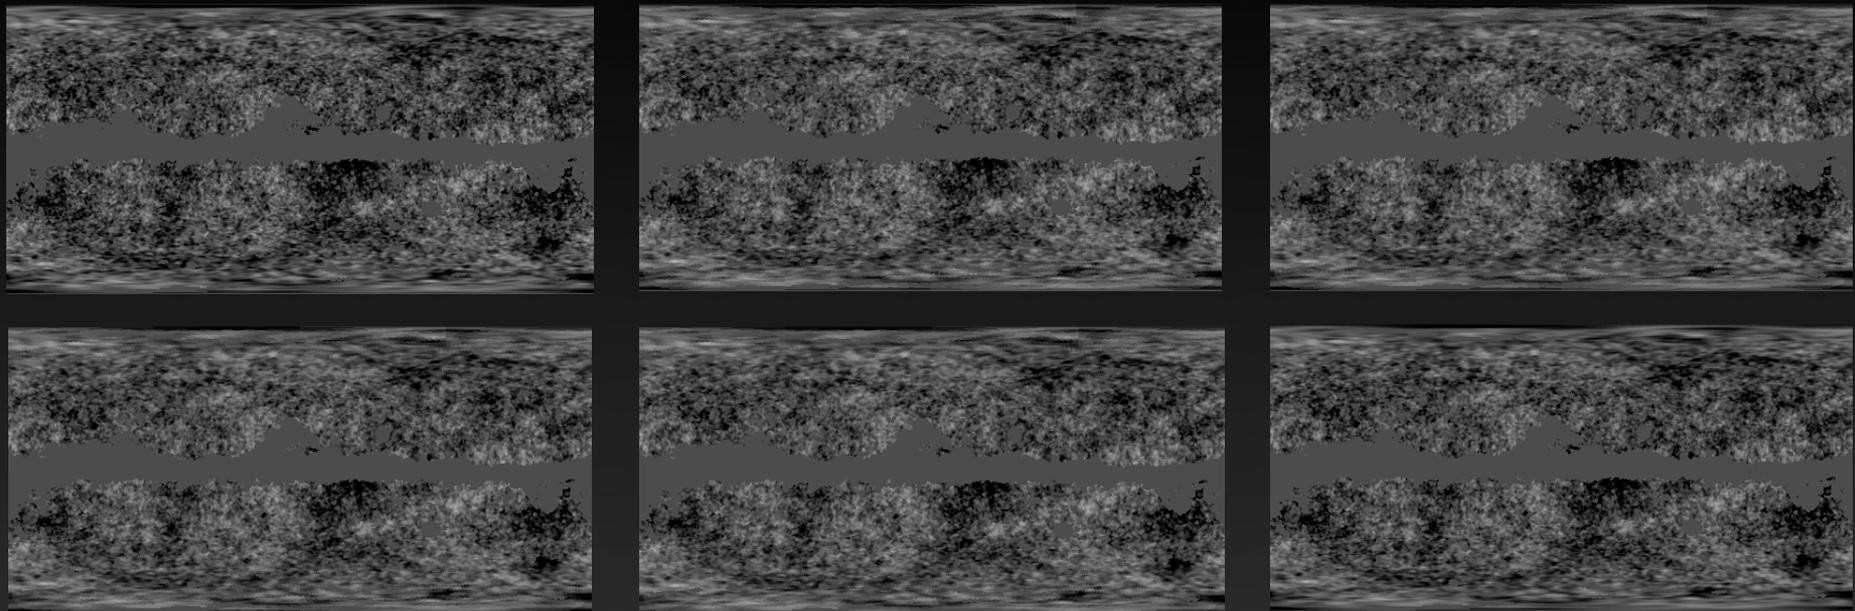

CMB "cross-correlation" bias

$$S_{23} \times \text{[Galaxy Map]} + f_{23} \times \text{[Galaxy Map]} + d_{23} \times \text{[Galaxy Map]} \\ = \text{[23 GHz Map]} - c_{23} \times \left(\text{[Noise Map]} + b_s \times \text{[Galaxy Map]} \right)$$

CMB "cross-correlation" bias

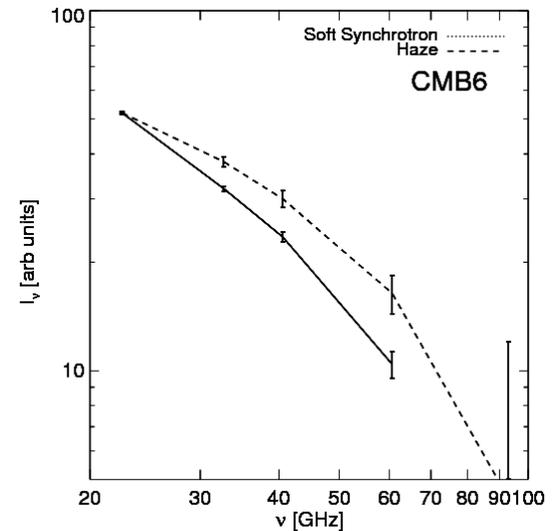

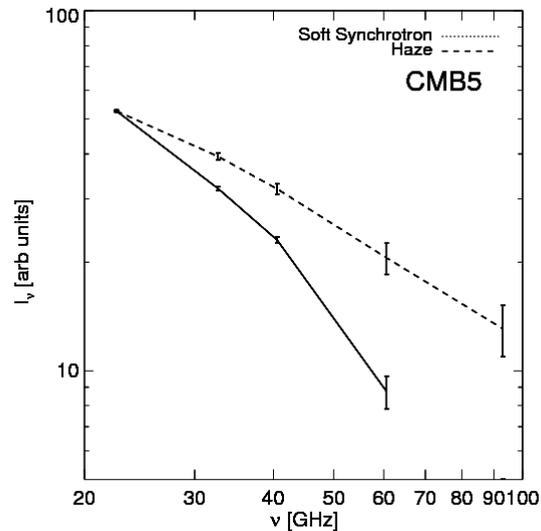

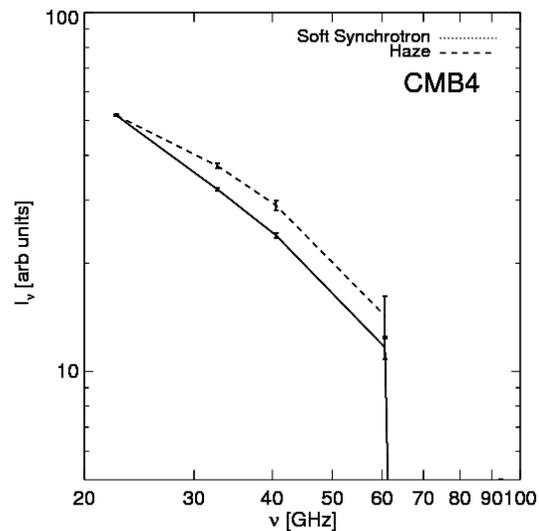

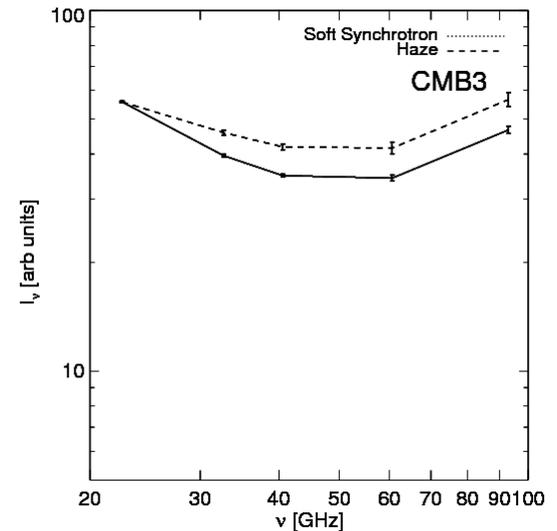

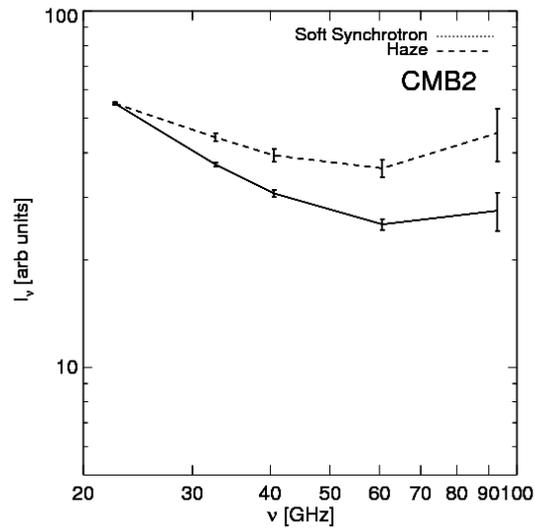

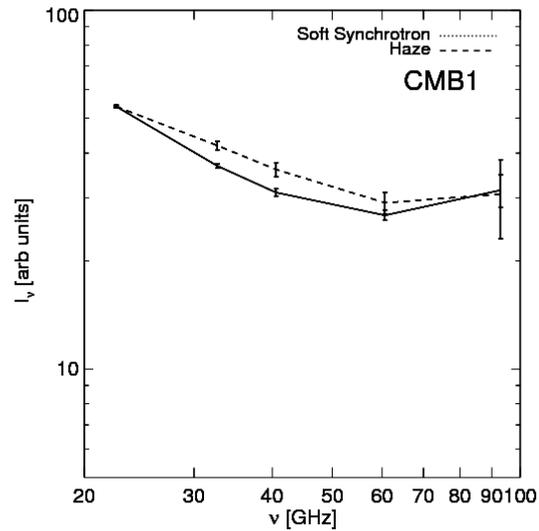

$$\begin{aligned}
 S_{23} \times \text{[CMB Map]} &+ f_{23} \times \text{[Galaxy Map]} + d_{23} \times \text{[Galaxy Map]} \\
 = \text{[23 GHz Map]} &- c_{23} \times \left(\text{[Noise Map]} + b_s \times \text{[Galaxy Map]} \right)
 \end{aligned}$$

$$s_v \rightarrow s_v - c_v \times b_s \quad f_v \rightarrow f_v - c_v \times b_f \quad d_{23} \rightarrow d_v - c_v \times b_d$$

the haze: facts

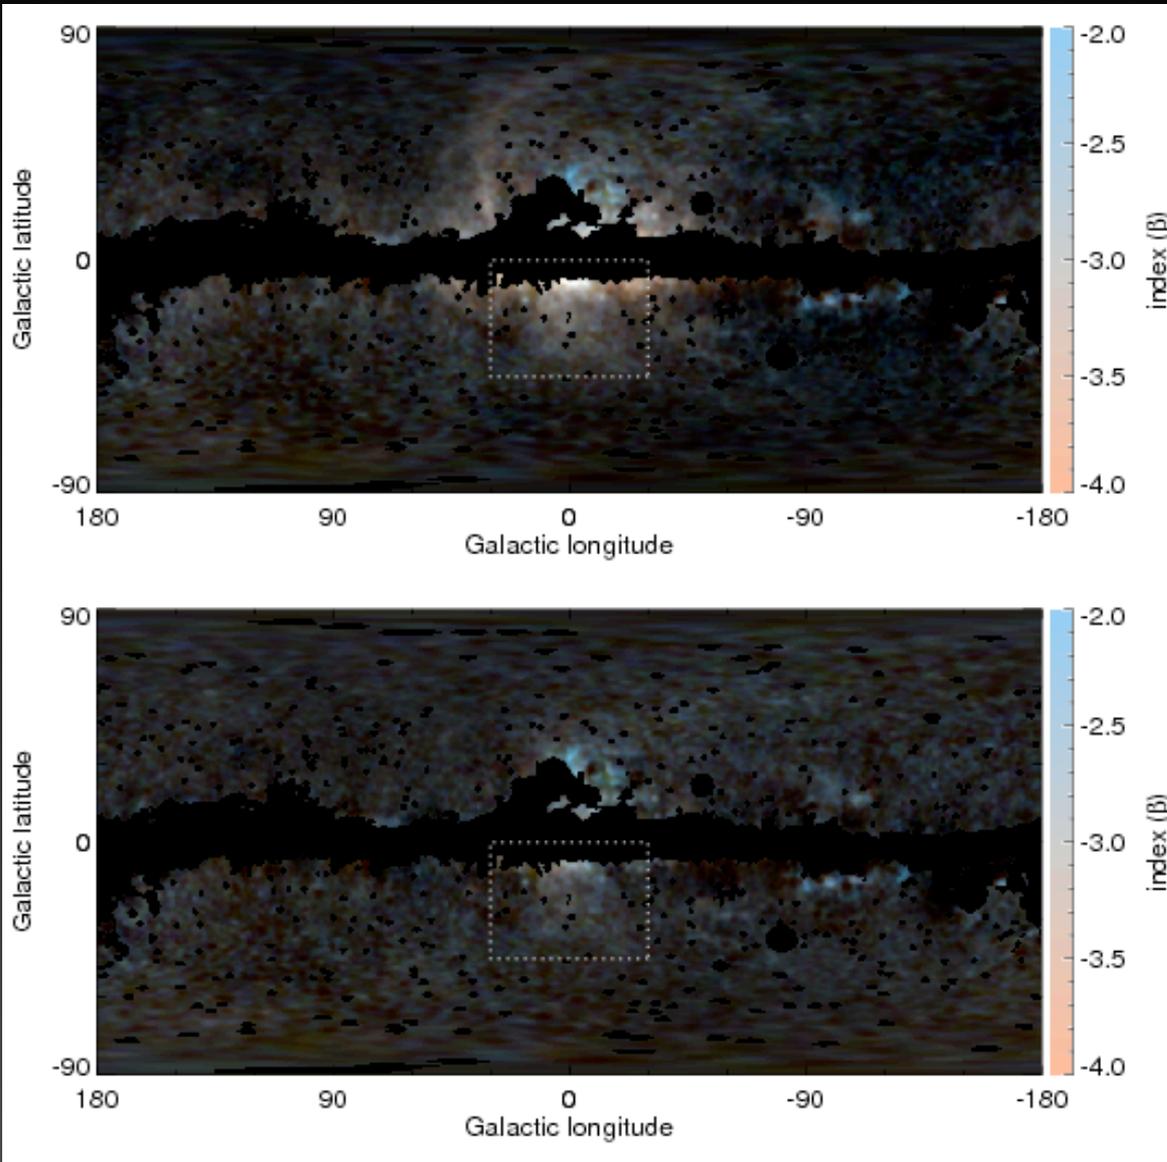

This ambiguity will be **eliminated** with *Planck*

the haze: facts

- foreground spectra have significant uncertainties
 - CMB cross-correlations (systematic)
 - template approximations
- spectrum is harder than synchrotron elsewhere in the galaxy
 - $I_{SN} \propto \nu^{-\alpha} \Rightarrow dN/dE \propto E^{-(2\alpha+1)}$
 - $I_{haze} \propto \nu^{-(\alpha-0.5)} \Rightarrow dN/dE \propto E^{-(2\alpha+1)}$

the haze: facts

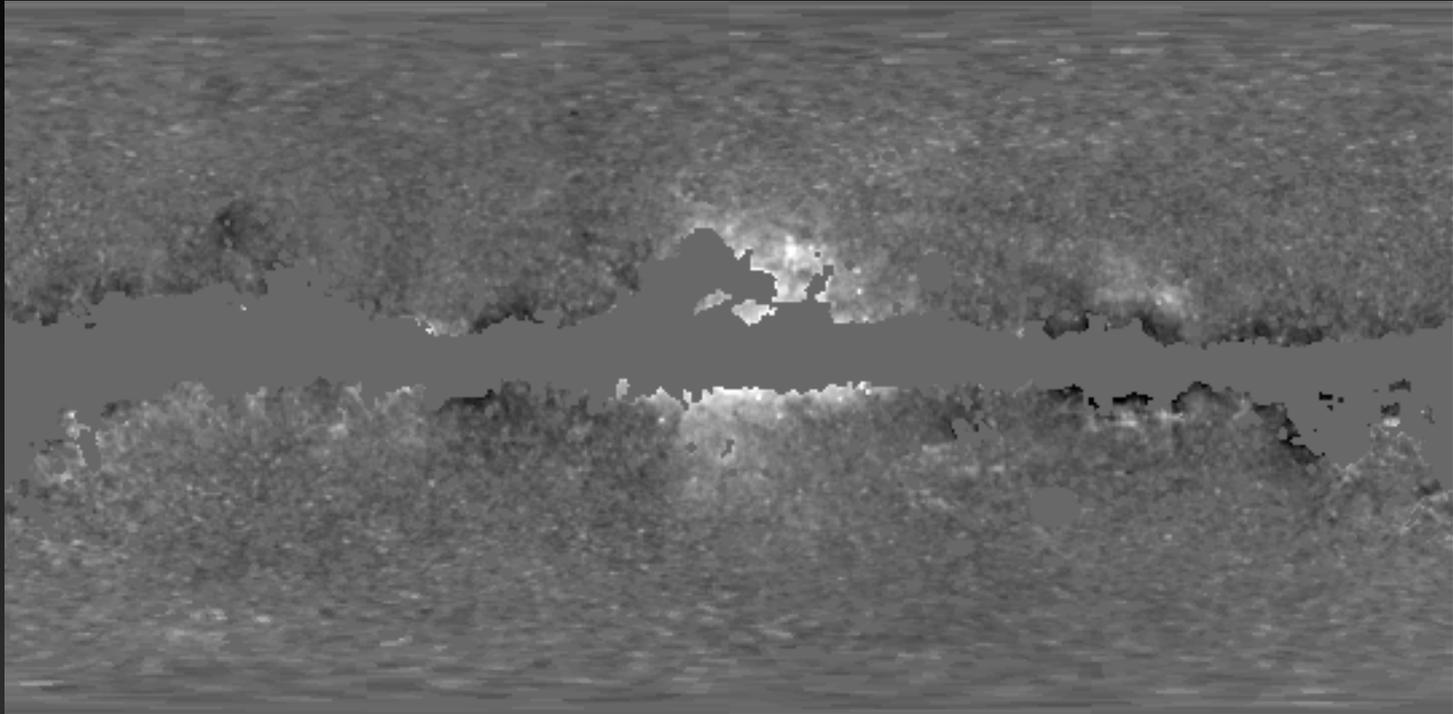

Dobler & Finkbeiner (2008)

the haze: facts

- spectra of foreground emissions have uncertainties
 - CMB cross-correlations (systematic)
 - template approximations
- spectrum is harder than synchrotron elsewhere in the galaxy
 - $I_{SN} \propto \nu^{-\alpha} \Rightarrow dN/dE \propto E^{-(2\alpha+1)}$
 - $I_{haze} \propto \nu^{-(\alpha-0.5)} \Rightarrow dN/dE \propto E^{-(2\alpha+1)}$
- morphology is **roughly** spherical, but there are inhomogeneities

the haze: facts

K-band: 23 GHz

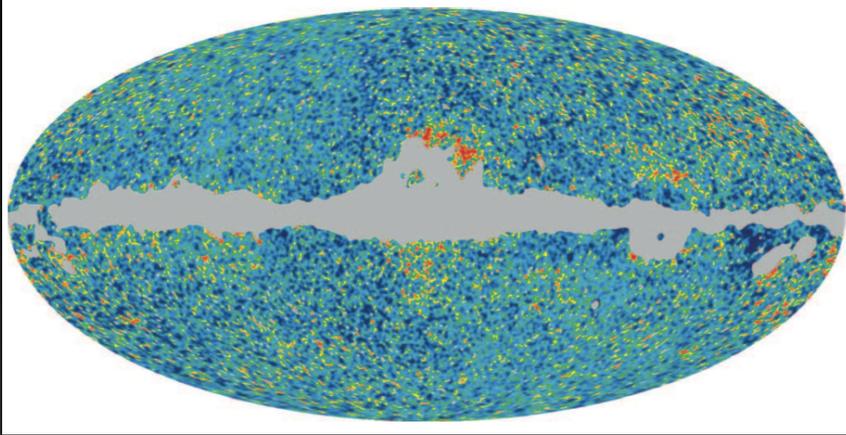

- WMAP - CMB - free-free
- (thermal and spinning) dust
- (soft) synchrotron

the haze: myths

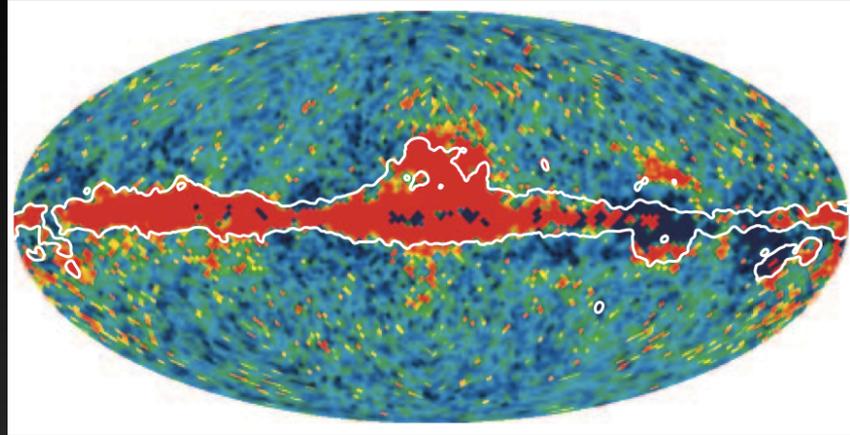

the haze...

. does not exist... nobody else sees it

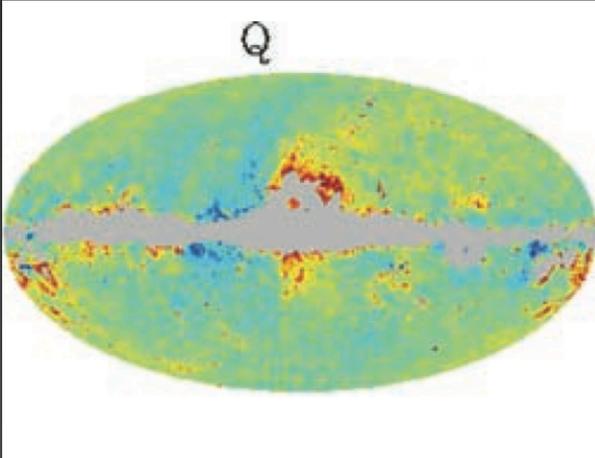

the haze: myths

the haze: myths

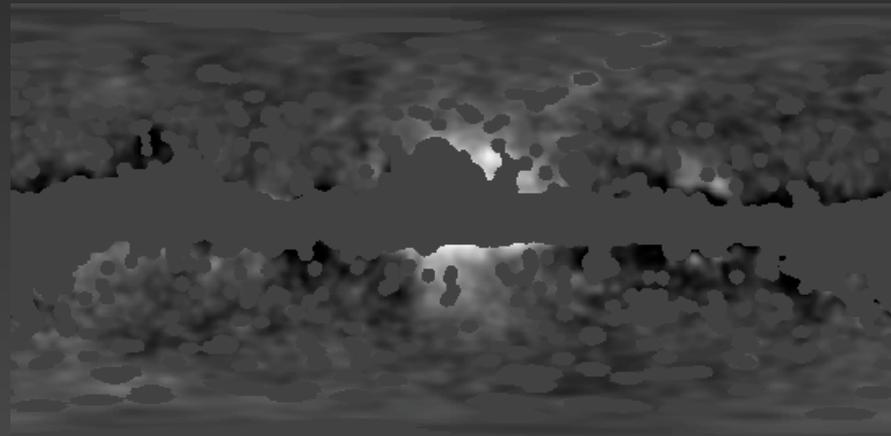

Bennett et al, 2003

Hinshaw et al, 2007

Bottino et al, 2008

Dickinson et al, 2009 (implied 23 GHz)

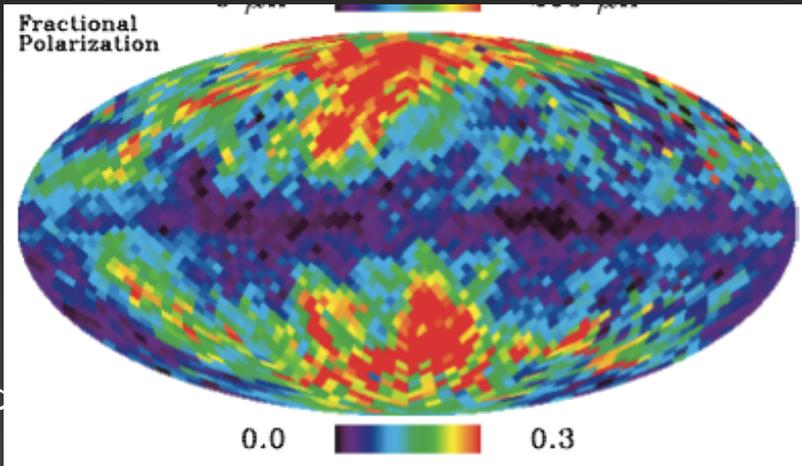

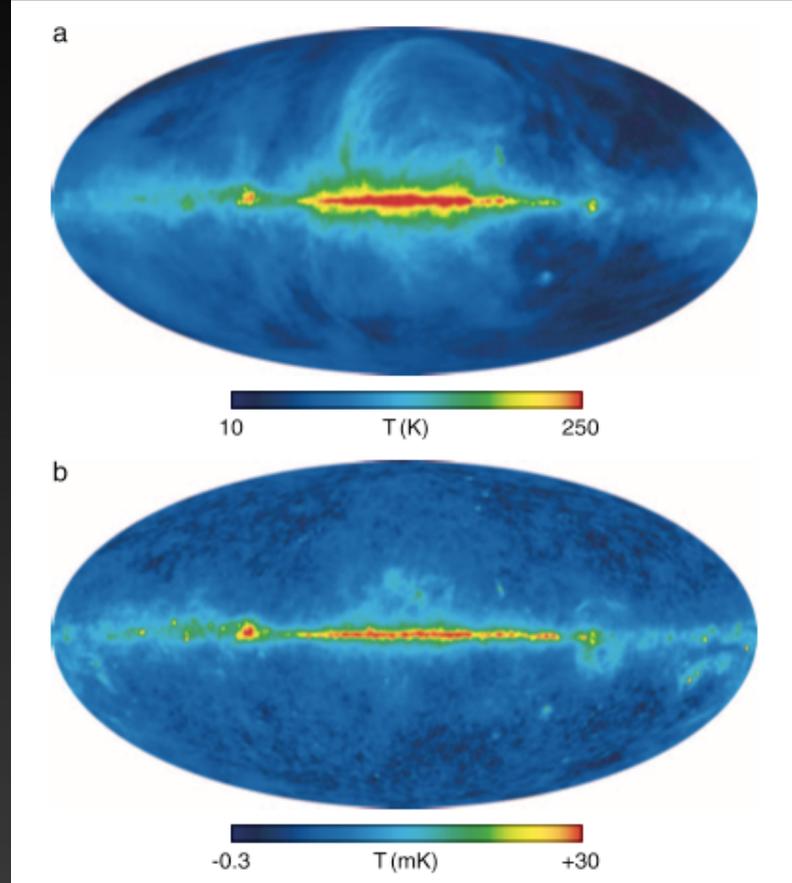

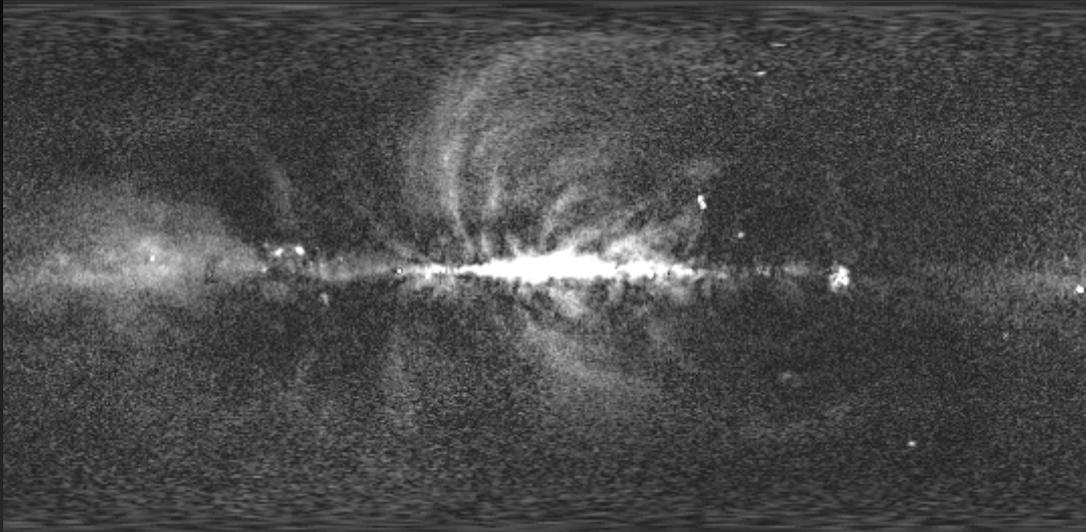

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized

the haze: myths

WMAP 23 GHz polarized emission

Kogut et al, 2007

Note: spinning dust is important when comparing to 23 GHz total intensity!

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized
- . is easily explained by SNe

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized
- . is easily explained by SNe
 - **diffused** haze spectrum is (roughly) as hard as fermi spectrum extending over $\sim (4 \text{ kpc})^3$ volume

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized
- . is easily explained by SNe
- . is easily explained by pulsars

the haze: myths

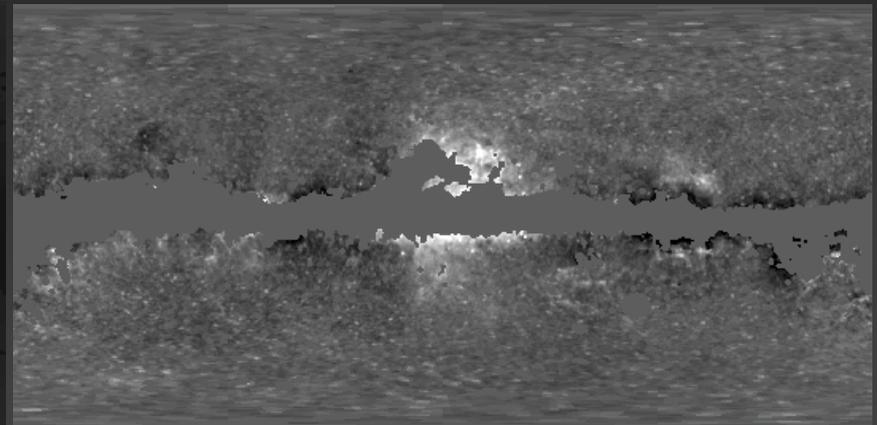

Injection spectrum :

$$dN/dE = N_0 \times f(E) \quad \text{with } N_0 = ??? \text{ and } f(E) = ???$$

⇒ can (likely) fit the haze spectrum

Spatial distribution :

$$\ln \rho(r,z) = -r/r_0 - |z|/z_0 \quad \text{with } r_0 = 4.5 \text{ kpc and } z_0 = 0.08 \text{ kpc}$$

⇒ cannot fit the morphology

the haze: myths

Injection spectrum :

$$dN/dE = N_0 \times f(E) \quad \text{with } N_0 = ??? \text{ and } f(E) = ???$$

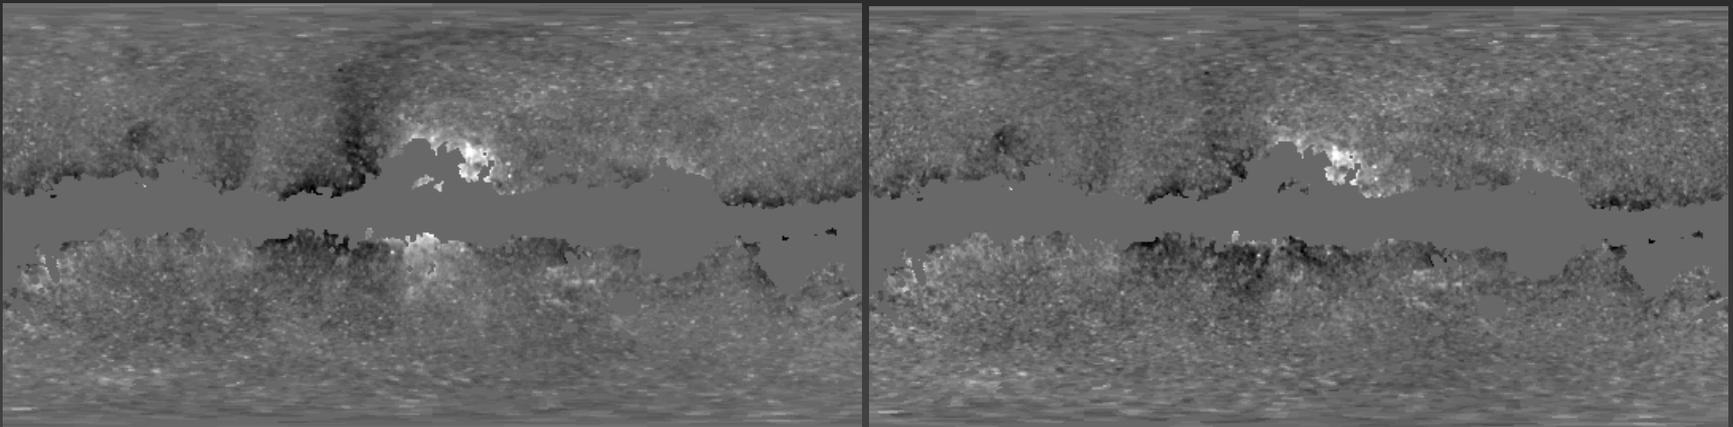

⇒ can (likely) fit the haze spectrum

Spatial distribution :

$$\ln \rho(r,z) = -r/r_0 - |z|/z_0 \quad \text{with } r_0 = 4.5 \text{ kpc and } z_0 = 0.08 \text{ kpc}$$

disky template

1/r template

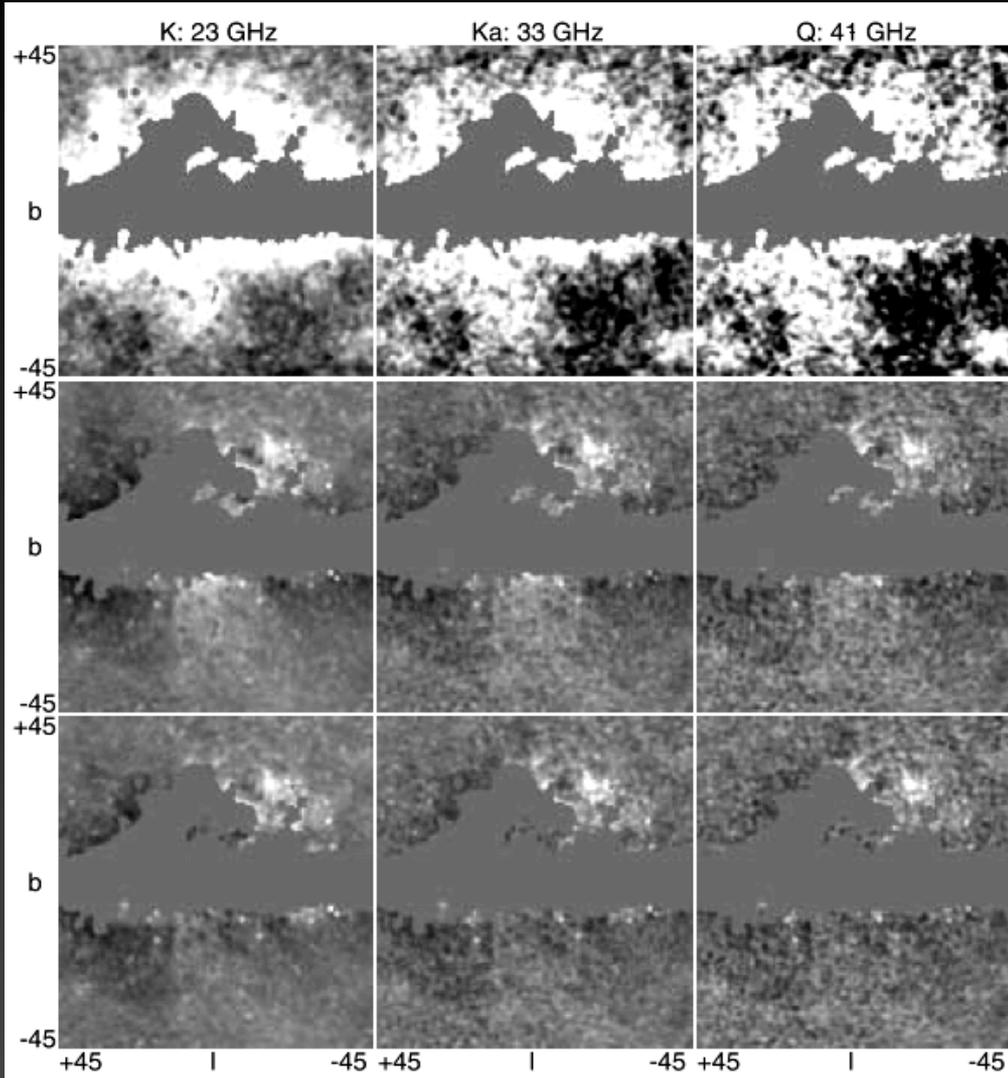

⇒ cannot fit the morphology

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized
- . is easily explained by SNe
- . is easily explained by pulsars
- . is easily explained by small spectral index variation of Haslam

the haze: myths

WMAP data

w/o haze
template

w/ haze
template

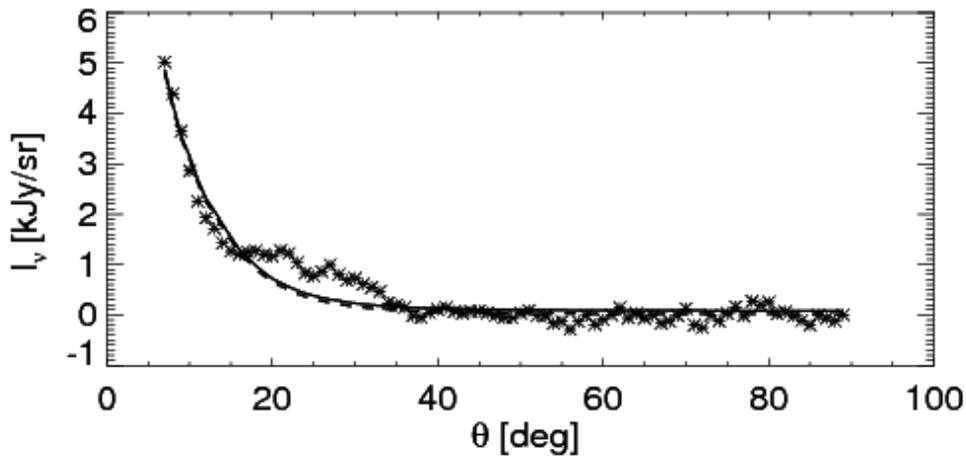

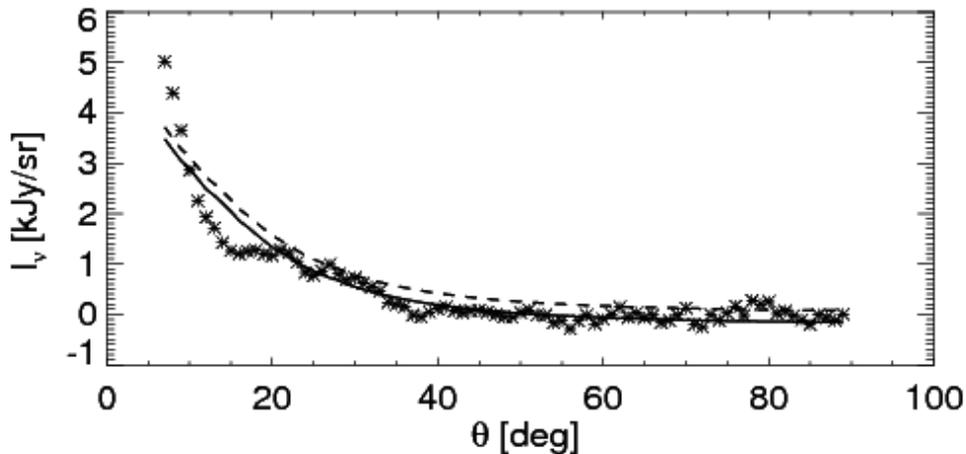

the haze is morphologically distinct from Haslam

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized
- . is easily explained by SNe
- . is easily explained by pulsars
- . is easily explained by small spectral index variation of Haslam
- . is direct evidence of particle DM annihilation

the haze: myths

Galactic/baryon params:

$$B \sim 10 \mu\text{G}$$

$$K(E) \sim 10^{28} \text{ cm}^2/\text{s}$$

Dark matter params:

$$\rho = \rho(r)$$

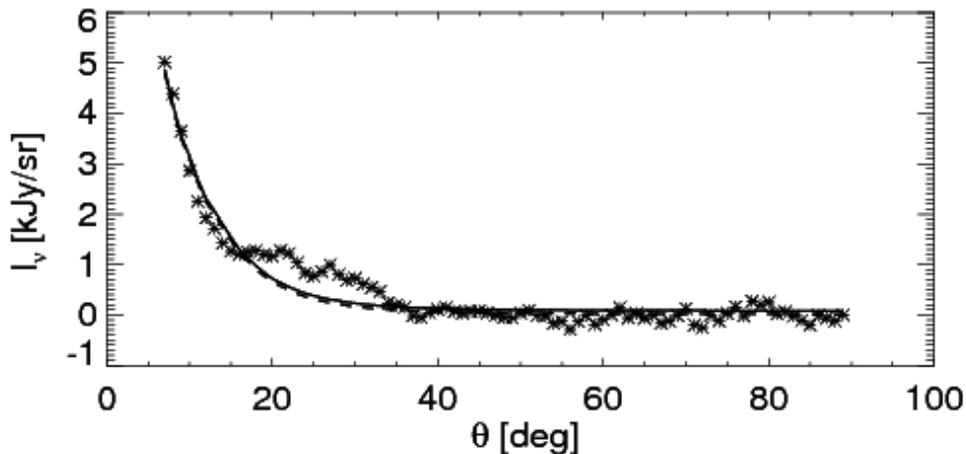

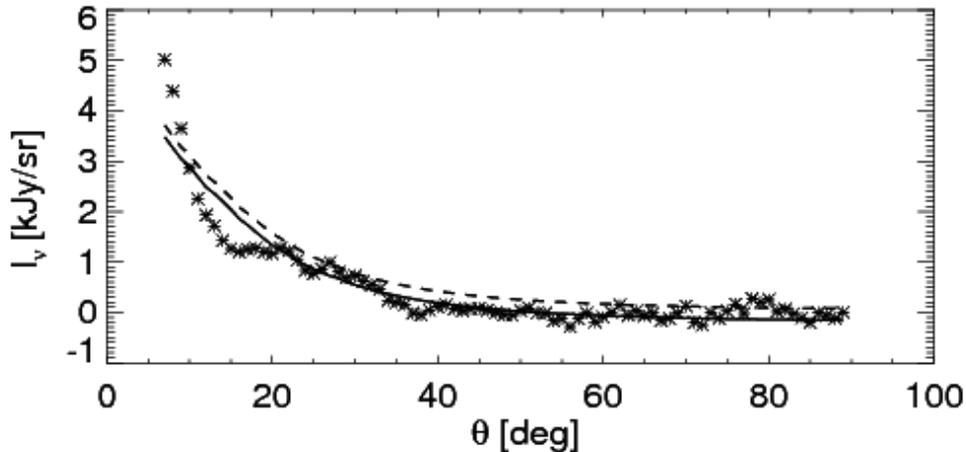

$$M \sim 100 \text{ GeV}$$

$$\langle\sigma v\rangle \sim \text{few } \times 10^{-26} \text{ cm}^3/\text{s}$$

the haze is

consistent with a
WIMP annihilation
scenario

the haze: myths

Galactic/baryon params:

$$B \sim 10 \mu\text{G}$$

$$K(E) \sim 10^{28} \text{ cm}^2/\text{s}$$

Dark matter params:

$$\rho = \rho(r)$$

$$M \sim 100 \text{ GeV}$$

$$\langle\sigma v\rangle \sim \text{few } \times 10^{-26} \text{ cm}^3/\text{s}$$

the haze is **consistent** with a WIMP annihilation scenario

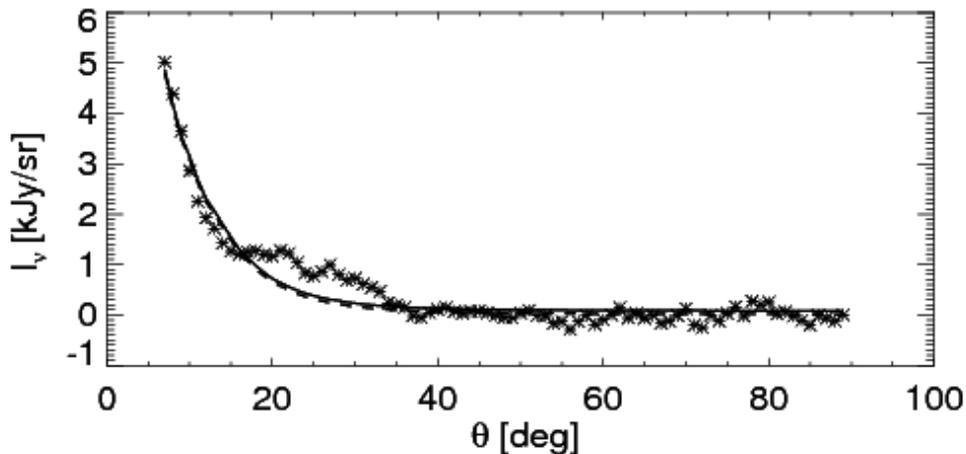

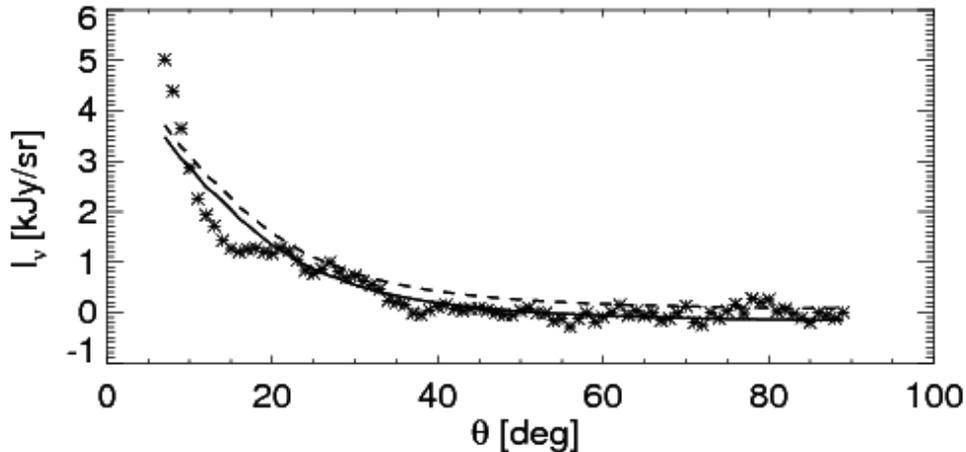

but again... there are large astrophysical uncertainties!

the haze: myths

the haze...

- . does not exist... nobody else sees it
- . should be strongly polarized
- . is easily explained by SNe
- . is easily explained by pulsars
- . is easily explained by small spectral index variation of Haslam
- . is direct evidence of particle DM annihilation
- . DM model over-produces synchrotron at high latitudes

the haze: myths

Galactic/baryon params:

$$B \sim 10 \mu\text{G}$$

$$K(E) \sim 10^{28} \text{ cm}^2/\text{s}$$

Dark matter params:

$$\rho = \rho(r)$$

$$M \sim 100 \text{ GeV}$$

$$\langle\sigma v\rangle \sim \text{few } \times 10^{-26} \text{ cm}^3/\text{s}$$

the haze is **consistent** with a WIMP annihilation scenario

but again... there are large astrophysical uncertainties!

comments and the future of the haze

. boundary conditions

- $dN/dE \rightarrow 0$ at boundary not very realistic
- spherical halo with $K(E) \rightarrow K(E,r,z)$

. full astro-uncertainties analysis for cross section and masses

- Galactic magnetic field: ≥ 2 (amplitude, shape, turbulence, etc.)
- ISRF: $\sim 1.2-1.5$ (see *Porter et al, 2008*)
- DM halo shape: ??? (local density ~ 2 , radial profile, sub-[sub-]structures $\sim 5-10$)
- uncertainties in haze analysis, etc...

. *Fermi* ICS emission towards the GC (regardless of origin)

. *Planck* spectral index measurements
